Gentleman *and* Tradesman's COMPLEAT ASSISTANT ;

Or, the Whole ART of

Measuring and Estimating, made Easy.

I N T H R E E P A R T S.

P A R T I.

Contains, the Names and exact
Prices of all Artificers Work
in General, relating to Build-
ing, viz. such as BRICKLAYERS,
CARPENTERS, JOINERS, CAR-

VERS, PLAISTERERS, PAINT-
ERS, MASONS, PLUMBERS, GLA-
ZIERs, SLATERS, PAVIOURS,
SMITHS, &c.

P A R T II.

Contains, the Method of Squaring
Dimensions, or measuring the
said Artificers Works at large,
thro' all their various Branches,
both by Cross-Multiplication
and Inspectionary Tables, to

the Extent of an hundred Feet
square, including Tables, which
shew the Number of Squares,
square Yards, and also the Square
Root of any Number of Feet, &c.
whatsoever required.

P A R T III.

Contains, Geometrical Defini-
tions of Lines, Angles, &c.
with the most useful and ne-
cessary PROBLEMS, or the

Rudiments of PRACTICAL GEO-
METRY, Mensuration of SUPER-
FICIES, &c.

Illustrated with COPPER-PLATES:

The Whole made perfectly easy and intelligible to the
meanest Capacity.

By J. LEADBEATER, and ASSISTANTS.

The SECOND EDITION.

L O N D O N :

Printed by SAMUEL CHANDLER,

For H. WEBLEY, Bookseller, in Holborn, near Chancery-Lane ;
and W. TODD, Accomptant, in Adam and Eve Court, opposite
Poland-Street, Oxford-Road.

P R E F A C E.

IF we do but consider what absolute necessity the ART of MEASURING is, in the Work of BUILDING, such as the buying in Materials thereunto belonging, as BOARD, TIMBER, STONE, &c. and also, the measuring of the several Artificers work employed therein (which measure their respective works, either by the foot or yard, square of 10 feet, rod, or the like); and also, how few of the great number of the said Artificers are capable of measuring, valuing, or estimating their own work; not only the Journeymen, or labouring part of Artificers, but even some Masters themselves, perhaps, labour under this misfortune, and can no-ways be made properly capable of understanding the same, without a Tutor.—And again, considering the great benefit which will redound to Gentlemen and Others, who have occasion to buy materials for (and also compleat the charge of their building) themselves, in every particular. In consideration of which, I have here, for their great convenience and advantage (together with able

a 2

Assistants,

Assistants, in the practical Parts of Building, &c.) given the Names, Rates, Qualities, and Quantities of the several Materials thereunto belonging, in the most plain and familiar way; with the nearest estimate possible, of their prices, and of the works of the several Artificers employed in Building; and that, not only as a Task-Master, but at such moderate rates, as will, I presume, be found both reasonable and agreeable to all those concern'd therein; by which assistance, Estimations, Valuations, and Contracts, may be made, without the least disadvantage to either party.

I have also, in the SECOND PART hereof, taken the pains to exemplify, at large, (by the most familiar Method of squaring Dimensions) the works of the said Artificers, through all their various branches, both by Cross-Multiplication, and also by inspectionary Tables, ready calculated, which shew the exact Content of any Measurement taken in Feet, Inches, and Parts, to the extent of fifty (or, if required, to an hundred) feet square; including also, Tables of Cubical, or Solid Measure, with others, for finding the number of Squares, Yards, Square and Square Root, of any number of Feet, &c. whatsoever required; by which help, any person, only acquainted so far with figures as to be able to add two numbers together, may measure either Board, Timber, or Stone, and also Bricklayers, Carpenters, Joiners, Plaisterers, Painters, Glaziers, Paviours, and Slaters works, with the greatest ease and exactness, by only taking the
Length

Length and Breadth of such work (whatever it be) by a two-foot rule, divided into Inches and Parts.

The THIRD PART, contains a choice Collection of Definitions and Problems, preparatory to PRACTICAL GEOMETRY, a Science of the greatest importance to all Artificers in general, if but well understood, being familiarly adapted to the unexperienced, in most respects whatsoever, conducing to their speedy improvement; and amongst which will be found, several particulars of the greatest use and benefit, never before treated of by any Authors whatsoever: therefore, in consideration of this Work, the Reader will find no pains hath been spared to render the said Book, not only in particular, but also, generally useful; and doubt not, but what it will meet with approbation from the Public, having already (as a proof of its Utility) been favoured with several Subscriptions, some of which, are persons of great experience and repute amongst those of the Building branch, who have express'd their highest opinion thereof in its favour; by which, we have this great encouragement now to hope, that the same will undoubtedly prove as intended, viz. A useful and profitable ASSISTANT to all whomsoever it may concern; which, that it may, is the hearty desire of the AUTHORS.

THE
Gentleman *and* Tradesman's
COMPLEAT ASSISTANT, &c.

P A R T I.

C H A P. I.

Of BRICKLAYER'S *Work*.

The different Dimensions and Sizes of Bricks.

THERE are several sizes of bricks, yet the statute allow but one; the scantlings of which are these, viz. the moulds in which bricks are usually made, ought to be in length (in the inside) 9 inches, in breadth 4 inches and an half, and in depth, or thickness, 2 inches and a half, of which size the brick ought to be; (tho' seldom found to hold out so)

B

for

2 *The GENTLEMAN and TRADESMAN'S*

for the drying and burning will abate something in the thickness, but very little in the breadth ; and in the length inconsiderable. Brick-work is measured by the rod or perch, containing 16 feet and an half, superficial measure, of which I shall speak more at large hereafter.

The quantity of lime and sand accounted sufficient to make mortar to lay 4500 bricks, (or one rod of wall) is one hundred and a quarter of lime, and two load and an half of sand ; the price of which, are both somewhat various ; and the measure of lime, in some places, is eight heap'd bushels. About London, lime is usually 9s. the hundred, and sand about 3s. 6d. per load.

Of Tiles ; their Quality, Size, and Make.

Tiles are of divers kinds ; but for building, principally, two sorts, viz. plain, and ridge tiles : The length of a plain tile, is usually 10 inches and an half, its breadth 6 inches, and its thickness near three quarters of an inch.

Of their Rate and Scale.

Tiles are rated and sold, after the manner of bricks, viz. by the thousand ; about 22 or 23 hundred weight gross, they account a load ; one tile weighs about two pounds and an half ; so that about 1000 tiles make a load. Tiling is measured by the square of 10 feet every way : The quantity of mortar required to every such
square

square of tiling, is about a quarter part of what is usually allowed for a rod of brick-work ; but it ought to be much dryer, and better wrought.

Of Laths ; their Scantlings and Quality.

Laths are principally of two sorts, allowed by statute ; the one of 5 feet long, the other, of 4 feet ; those of 5 feet, have 5 score, or 100 in the bundle ; the other, of 4 feet, have six score, or 120 in the bundle ; and of either of these lengths, there are three sorts : first, Heart of Oak ; secondly, Sap-laths ; and, thirdly, Deal-laths : as to the reason of these different lengths, the goodness of the stuff of which they are made, &c. is, by reason all rafters, upon which the laths are nail'd, are not spaced at an equal distance ; and for the goodness of the stuff, those of Heart of Oak being the best, are most necessary for tiling ; the second sort of Sap-laths are for plaistered walls ; and those of Deal, for cielings.

Of the Rate and Price.

In respect to the prices of laths, it must needs be various, seeing there is so great a disparity in the commodity ; but in general, are from 1 s. to 2 s. per bundle ; the Heart laths are about 2 s. the bundle.

4 *The GENTLEMAN and TRADESMAN'S*

Of the Distance Laths are usually laid upon the Roof of a House one from another.

The distance in laying of laths one from another, is various, differing more in some places than in others; but 3 inches and an half, and 4 inches, are usual distances, with a counrer-lath between rafter and rafter; or two, if the rafters stand at a very large distance. The quantity of nails required for laying on a bundle of laths of 5 feet long, are 500; and to the other of 4 feet long, 600, six score to the hundred; and the number of laths and tiles sufficient to cover a yard square, (that is, 3 feet every way) are three-score tiles laid at a 7-inch gauge; but tiling (as I said before) is measured by the square, so that it will require 665 tiles, or nearly one peck of pins, and one bundle of laths; and one tiler, in a day, will cover such a square.

The Prices of Bricks.

I. *Of FOUNDATION.*

| | £. | s. | d. |
|---|----|----|----|

Expla-

Explanation of the foregoing Tables.

At the head of the table you have the thickness of any wall in bricks and half bricks, for any thickness; from half a brick to six bricks thick, under several columns; and in the first, towards the left hand, you may find the number of rods that any wall contains upon the superficies thereof, from 1 quarter of a rod to 21 rods; and in several columns, you have the rods, in the first column, reduced to the customary thickness of one brick and an half, as will best appear by the following examples.

The Use of the TABLE.

EXAMPLE I.

If a wall, measured upon the superficies thereof, be found to contain 9 rods, and the wall be 2 bricks and an half thick, how many rods doth the same wall contain, it being reduced to the customary thickness of one brick and an half?

Look for 9 rods (the measure of the wall upon the flat) in the first column towards the left hand, and find $2\frac{1}{2}$ bricks (the thickness of the wall at the head of the table, and against 9 in the first column, and under $2\frac{1}{2}$ bricks on the head, you will find 15 rod; and so much doth the wall contain.

12 *The GENTLEMAN and TRADESMAN'S*

And so by the following table you may find, that if a wall upon the flat do contain 13 rod, if that wall be

| Thickness | | r. | q. | f. |
|----------------|--|----|----|----|
| $\frac{1}{2}$ | } Bricks thick, it will contain, being reduced to one brick and an half, | 4 | 1 | 22 |
| 1 | | 8 | 2 | 45 |
| $1\frac{1}{2}$ | | 13 | 0 | 0 |
| 2 | | 17 | 1 | 22 |
| $2\frac{1}{2}$ | | 21 | 2 | 45 |
| 3 | | 26 | 0 | 0 |
| $3\frac{1}{2}$ | | 30 | 1 | 22 |
| 4 | | 34 | 2 | 45 |
| $4\frac{1}{2}$ | | 39 | 0 | 0 |
| 5 | | 43 | 1 | 22 |
| $5\frac{1}{2}$ | | 47 | 2 | 45 |

Contents reduced.

E X A M P L E II.

If a wall be 4 bricks thick, and contains 17 rod upon the flat, how much doth it contain, being reduced?

Look for 17 in the first column, and against under 4 bricks you will find 45 rod, 1 quarter, and 22 feet; and so much doth the wall contain, being reduced; and so if a wall

| | | | | | | |
|---------|---|--|--|---|--|---|
| contain | $\left\{ \begin{array}{l} 12 \\ 17 \\ 7 \end{array} \right\}$ | $\left\{ \begin{array}{l} \text{rod upon the} \\ \text{flat, and be} \end{array} \right\}$ | $\left\{ \begin{array}{l} 3\frac{1}{2} \\ 2 \\ 5 \end{array} \right\}$ | $\left\{ \begin{array}{l} \text{thick, it will con-} \\ \text{tain, being re-} \\ \text{duced,} \end{array} \right\}$ | $\left\{ \begin{array}{l} 28 \\ 22 \\ 23 \end{array} \right\}$ | $\left\{ \begin{array}{l} \text{r.} \\ \text{q.} \\ \text{f.} \end{array} \right\}$ |
| | | | | | | $\left\{ \begin{array}{l} 0 \\ 2 \\ 1 \end{array} \right\}$ |
| | | | | | | $\left\{ \begin{array}{l} 0 \\ 45 \\ 22 \end{array} \right\}$ |

E X A M-

E X A M P L E III.

If a wall upon the flat do contain 13 rod and 3 quarters, and be $4 \frac{1}{2}$ bricks thick, how many rod shall that wall contain, when it is reduced?

| | r. | q. | f. |
|--|----|----|----|
| 13 rod upon the flat, and $4 \frac{1}{2}$ bricks thick, is | — | — | — |
| 3 quarters of a rod, and $4 \frac{1}{2}$ bricks thick, is | — | — | — |
| 13 $\frac{3}{4}$ rods upon the flat, reduced, is | 41 | 1 | 0 |

E X A M P L E IV.

If a wall upon the flat do contain 8 rods, and be $9 \frac{1}{2}$ bricks thick, how much doth that wall contain, being reduced?

In the table (at the head thereof) you cannot find $9 \frac{1}{2}$ bricks, but may find $5 \frac{1}{2}$ and 4 bricks thick, which, together, make $9 \frac{1}{2}$ thick; then by the table,

| | r. | q. | f. |
|--|----|----|----|
| 8 rod by $5 \frac{1}{2}$ bricks thick, reduced, is | 29 | 1 | 2 |
| 8 rod at 4 bricks, reduced, is | — | 21 | 12 |
| 8 rod at $9 \frac{1}{2}$, reduced, will be | — | 50 | 24 |

therefore, these examples, I presume, may be sufficient to shew the great use of these tables.

A second Table of Brick-work.

| 24000 | 129813 | 242323 | 396989 | 529369 | 686175 |
| 25000 | 134306 | 252420 | 413530 | 551426 | 714765 |

thus, Seek, as before directed, for the nearest even number in the first column of the table, which you will find to be 1000; the number opposite, under $2 \frac{1}{2}$ bricks, you will find to be 28590; then look back in the column for 500, the number yet wanting, and you will find opposite, in the same column, 14295; which being added,

| thus, | | bricks |
|--|----------|--------|
| 1000 feet, at $2 \frac{1}{2}$ bricks thick, is | | 28590 |
| 500 feet, at ditto | ditto is | 14295 |

| | |
|--|---------------------|
| 1500 feet, at $2 \frac{1}{2}$ bricks thick, is | 42885 as required : |
|--|---------------------|

further examples would be unnecessary.

C H A P. II.

Of Carpenters and Joiners Work.

Carpenters commonly work by the square of 10 foot, in erecting their carcases; that is, framing and setting up; with their partitions, floors, rafters, and such like; and their work is to be valued according to the goodness of the timber, the quantity thereof, &c. the particulars of which, you have here an account of at large, with the prices thereof; both with the materials included, or where the workmanship only is required.

And first, of Framing.

| | | | | |
|--------------------------------------|---|----|----|----|
| For framing the outside carcase of a | } | £. | s. | d. |
| house, where the hewing and saw- | | | | |
| ing are included; workmanship | | 0 | 11 | 0 |
| per square, containing 100 super- | | | | |
| ficial feet | - | - | - | - |

For

| | £. | s. | d. |

Of the proper Scantlings for the cutting of Timber, according to Directions laid down by several eminent Workmen of the greatest Experience.

Of PRINCIPAL POSTS for SMALL BUILDINGS.

Posts of Fir 8 feet in height, and 4 inches square

Ditto 10 feet ditto, and 5 inches ditto

Ditto 12 feet ditto, and 6 inches ditto

Posts of Oak 10 feet in height, and 6 inches square

Ditto 12 feet ditto, and 8 inches square

Ditto 14 feet ditto, and 10 inches square

For LARGE BUILDINGS.

Posts of Fir 8 feet in height, and 5 inches square

Ditto 12 feet ditto, and 8 inches square

Ditto 16 feet ditto, and 10 inches square

Oak posts 8 feet in height, and 5 inches square

Ditto 12 feet ditto, and 12 inches square

Ditto 16 feet ditto, and 16 inches square

The SCANTLING of GIRDERS.

- If the length of a Fir girder be 10 feet, its scantling must be 8 inches by 10
 If 12 ditto, its scantling must be $8 \frac{1}{2}$ inches by 10
 If 14 ditto, its scantling must be 9 inches by $10 \frac{1}{2}$
 If 16 ditto, its scantling must be 10 inches by 11
 If 18 ditto, its scantling must be 11 inches by 12
 If 20 ditto, its scantling must be $11 \frac{1}{2}$ inches by 13
 If 22 ditto, its scantling must be 12 inches by 14
 If a girder of Fir in a small building be 16 feet in length, its scantling must be 8 inches by 11
 If 20 ditto, its scantling must be 8 inches by 11
 If 20 ditto, its scantling must be 10 inches by $12 \frac{1}{2}$
 If 24 ditto, its scantling must be 12 inches by 14
 But if of Oak, then the scantling must be 10 inches by 13, 12 inches by 14, and 14 inches by 15

In LARGE BUILDINGS.

- If a fir girder be in length 16 feet, its scantling must be $9 \frac{1}{2}$ inches by 13

If

32 *The GENTLEMAN and TRADESMAN'S*

If 20 ditto, its scantling must be 12 inches by 14

If 24 ditto, its scantling must be $13 \frac{1}{2}$ inches by 15

If a girder of Oak in length be 16 feet, its scantling must be 12 inches by 14

If 20 ditto, its scantling must be 15 inches by 15

If 24 ditto, its scantling must be 18 inches by 16

The SCANTLING of common and trimming Joists:

Trimming joists in length being 5 feet, its scantling must be 7 inches by 3

If 6 ditto, its scantling must be 7 inches by 4

If 7 ditto, its scantling must be 7 inches by 5

If 8 ditto, its scantling must be 8 inches by 4

If 9 ditto, its scantling must be 8 inches by 5

If 10 ditto, its scantling must be 9 inches by 6

Common joists, being in length 5 feet, its scantling must be 7 inches by $2 \frac{1}{2}$

If 6 ditto, its scantling must be 7 inches by $2 \frac{1}{2}$

If 7 ditto, its scantling must be 7 inches by $2 \frac{3}{4}$

If 8 ditto, its scantling must be 8 inches by 3

If 10 ditto, its scantling must be 8 inches by $3 \frac{1}{4}$

If 11 ditto, its scantling must be 8 inches by $3 \frac{1}{2}$

If 12 ditto, its scantling must be 9 inches by 4

The SCANTLING of JOISTS for SMALL BUILDINGS.

Fir joists, 6 feet long, must be 5 inches by $2 \frac{1}{2}$

Ditto, 9 ditto, must be $6 \frac{1}{2}$ inches by $2 \frac{1}{2}$

Ditto, 12 ditto, must be 8 inches by $2 \frac{1}{2}$

Oak

Ditto Oak, 6 feet long, must be 5 inches by 3
 Ditto, 9 ditto, must be $7\frac{1}{2}$ inches by 3
 Ditto, 12 ditto, must be 10 inches by 3.

For LARGE BUILDINGS.

Fir joists, 6 feet long, must be 5 inches by 3
 Ditto, 9 ditto, must be $7\frac{1}{2}$ inches by 3
 Ditto, 12 ditto, must be 10 inches by 3
 Oak ditto, 6 ditto, must be 6 inches by 3
 Ditto, 9 ditto, must be 9 inches by 3
 Ditto, 12 ditto, must be 12 inches by 3.

Of bridging JOISTS in SMALL BUILDINGS.

Bridging joists of Fir, whose bearing is 6 feet,
 must have a scantling of 4 feet by $2\frac{1}{2}$
 Ditto of Oak, ditto, 4 feet by 3
 Fir, 8 foot, must have ditto, 5 feet $\frac{1}{2}$ by $2\frac{1}{4}$
 Ditto of Oak, ditto, 5 feet $\frac{1}{2}$ by 3
 Fir, 10 foot, must have ditto, 6 feet by 3
 Ditto of Oak, ditto, 7 feet by 3.

Of bridging JOISTS in LARGE BUILDINGS.

Fir-bridging joists, whose bearings are 6 feet,
 must have a scantling of 4 inches by 3
 Ditto of Oak, ditto, 5 inches by $3\frac{1}{2}$
 Fir, 8 foot, must have ditto, $5\frac{1}{2}$ inches by 3
 Ditto of Oak, ditto, $6\frac{1}{2}$ inches by $3\frac{1}{2}$
 Fir, 10 foot, must have ditto, 7 inches by 3
 Ditto of Oak, ditto, 8 inches by $3\frac{1}{2}$

SCANTLINGS *for* BEAMS.

| | | |
|---|-------|--|
| If the bearing of the beam in the clear, be 12 feet, its scantling must be $6\frac{1}{4}$ inches by 8 | | |
| If 16 ditto, | ditto | $6\frac{1}{2}$ inches by $8\frac{1}{2}$ |
| If 20 ditto, | ditto | 6 inches by 9 |
| If 24 ditto, | ditto | 7 inches by 9 |
| If 28 ditto, | ditto | $7\frac{1}{2}$ inches by $9\frac{1}{2}$ |
| If 32 ditto, | ditto | 8 inches by 10 |
| If 36 ditto, | ditto | $8\frac{1}{2}$ inches by $10\frac{1}{2}$ |
| If 40 ditto, | ditto | $8\frac{1}{2}$ by 11 |

The proper SCANTLINGS for BEAMS and RAFTERS, are as follow, viz.

First, for Beams or Ties for SMALL BUILDINGS.

If the length of a beam of Fir be 30 feet, its scantling must be 6 inches by 7

Ditto of Oak, ditto, 7 inches by 8

Fir, 45 feet, its scantling must be 9 inches by $8\frac{1}{2}$

Ditto of Oak, ditto, 10 inches by $11\frac{1}{2}$

Fir, 60 feet, its scantling must be 12 inches by 11

Ditto of Oak, ditto, 13 inches by 15

For LARGE BUILDINGS.

If the length of a beam of Fir be 30 feet, its scantling must be 7 inches by 8

Ditto of Oak, ditto, 8 inches by 8

If 45 feet, its scantling must be 10 inches by $11\frac{1}{2}$

Ditto of Oak, ditto, 11 inches by $11\frac{1}{2}$

If 60 feet, its scantling must be 13 inches by 15

Ditto of Oak, ditto, 14 inches by 15.

For

For PRINCIPAL RAFTERS in SMALL BUILDINGS.

If a rafter of Fir be in length 24 feet, its scantling at top must be 5 inches by 6, and at bottom, 6 inches by 7

If 36 feet at top, $6\frac{1}{2}$ inches by 8, ditto at bottom, 8 inches by 10

If 48 feet at top, 8 inches by 10, at bottom, 10 inches by 12

But if at top, of Oak ditto.

7 inches by 8, and at bottom, 8 inches by 9

8 inches by 9, ditto 9 ditto by $10\frac{1}{2}$

9 inches by 10, ditto 10 ditto by 12

For LARGE BUILDINGS.

If the rafter be of Fir, and its length 24 feet, its scantling at top must be 7 inches by 8
and at bottom, 8 inches by 9

If 36 feet at top, 8 inches by 9
at bottom, 9 inches by $10\frac{1}{2}$

If 48 feet at top, 9 inches by 10
at bottom, 10 inches by 12

But if of Oak at top, 8 inches by 9
at bottom, 9 inches by 10

at top, 9 inches by 10

at bottom, 10 inches by 12

at top, 10 inches by 12

at bottom, 12 inches by 14

For SMALL RAFTERS in SMALL BUILDINGS.

If the rafter be of Fir, and its bearing be 8 feet, its scantling must be $3\frac{1}{2}$ inches by $2\frac{1}{2}$

36 *The GENTLEMAN and TRADESMAN'S*

If 10 feet, ditto, $4\frac{1}{2}$ inches by $2\frac{1}{2}$

If 12 feet, ditto, $5\frac{1}{2}$ inches by $2\frac{1}{2}$

But if of Oak, $4\frac{1}{2}$ inches by 3

$5\frac{1}{2}$ inches by 3

$6\frac{1}{2}$ inches by 3

For LARGE BUILDINGS,

If the rafter be of Fir, and its bearing be 8 feet,
its scantling must be $4\frac{1}{2}$ inches by 3

If 10 feet, ditto, $5\frac{1}{2}$ inches by 3

If 12 feet, ditto, $6\frac{1}{2}$ inches by 3

But if of Oak, $5\frac{1}{2}$ inches by 3

7 inches by 3

9 inches by 3

P U R L O I N S.

Scantlings for Purloins must be cut from 9 inches by 8, to 9 inches by 12, in large buildings, where they are framed into the principal rafters; but for common small buildings, where they are laid into the collar-beams, from 4 inches by 5, to 5 inches by 6.

SCANTLINGS for CELLS and OVER-WAYS, are cut from 8 inches by 9, to 9 inches by 6.

RAISING-PLATES are cut to scantlings, from 8 inches by 5, to 9 inches by 6.

Note, In respect to laying down the price or value of a square of framing, I shall not here presume, being a task too difficult to perform, unless

unless buildings were all of one size, and of the same length, breadth, and height ; then, indeed, it would be very easy to lay down a rule that would hold good in general ; But whereas, the various forms and magnitudes of buildings, require different scantlings of timber, consequently the value thereof must be more or less accordingly. The best method that I can here recommend for this purpose, is, first of all, to draw a plan of the whole design, from which to draw every particular part, in respect to the form and fashion thereof, from which you may make an estimate of what timber will be required, according to the dimensions of each particular part ; from which you may then calculate the value thereof, according to the several contents, in square feet, yards, &c.

The following prices of the several kinds of Carpenters and Joiners work, viz. (labour only) are warranted original, having never before appear'd in public, consequently not to be met with elsewhere, in any publication whatsoever ; in respect to which, numbers of workmen have hitherto been entirely unacquainted with, therefore will now (being made public) undoubtedly prove beneficial to them in general.

C H A P. III.

Of PLAISTERERS WORK.

PLAISTERERS commonly work by the yard square; and their work is principally of two kinds, namely; 1st. Works lathed or plastered, which they call Cieling; 2d. Works rendered, which are of two kinds, viz. upon brick walls, or between quarters, in the partitions between rooms; all which are measured by the yard square, or square of 3 feet, which is 9 feet.

The prices of which, according to the nature and quality of the work, you have here following at large, viz.

| | £. | s. | d. |
|--|----|----|-------|
| Grey plaster floors, two inches and an half thick, per square - - - } | 2 | 7 | 6 |
| Workmanship only, per square - - - | 1 | 2 | 6 |
| Red plaster floors, per square ditto - - | 3 | 7 | 6 |
| Workmanship only, per square ditto - - | 1 | 6 | 6 |
| Stoco on Fir laths, per yard square - - - - - } | 0 | 2 | 0 |

| Corinthian cornishes, fully inrich'd, per foot - - - - | 0 | 2 | 0 |
| Ionic ditto, per foot - - - - | 0 | 1 | 7 |
| Plain ditto, per foot - - - - | 0 | 1 | 2 |
| Inrich'd friezes, with Oak leaves, acorns, &c. per foot - - - - | 0 | 1 | 10 |
| Large frames on stair-cases, &c. fully inrich'd, per foot - - - - | 0 | 2 | 0 |
| Large festoons of fruit and flowers, &c. per foot - - - - | | 4 | 0 |

Note,

Note, In the last eight articles, viz. the ornaments, you may, in respect to the materials, allow two-pence per foot, it being all of fine stuff.

C H A P. IV.

Of CARVERS WORK.

IN respect to the prices in general, relating to Carvers Work, it is almost impossible here to be particular, by reason of the great uncertainty thereof, being for the most part proportioned according to the richness of the work, the nature and quality of materials they work upon, &c. therefore, shall only think necessary to give the following estimate thereof, which, in common, are such, as will be found the least subject to variation, viz.

| | L. | s. | d. |
|--|----|----|---------|
| Ovolo to Deal framing, carv'd, with eggs, per foot running - - - | 0 | 0 | 10 |
| O G to Deal framing, carv'd, with seven-leav'd grass, per foot running | 0 | 0 | 9 |
| Ovolo to framing in right wainscot, carv'd, with eggs, per foot running — — — | 0 | 1 | 2 |
| Small O G to the raising of pannels in Deal, carv'd, with three-leav'd grass, per foot — — — | 0 | 0 | 4 |
| | G | 2 | |
| | | | Carving |

| | £. | s. | d. |
|--|---------|----|----|
| Carving the Ionic capitals, per foot facio _____ | } 0 | 6 | 10 |
| Ditto the Corinthian and Composite capitals, at per foot facio, work about _____ | | | |
| | } 0 9 8 | | |

C H A P. V.

Of PAINTERS WORK.

IN taking the dimensions of Painters Work, it is the same as that of Joiners, by girting over the mouldings and swelling pannels, in taking the height (and it is but reason they should be paid for that on which their time and colour are both expended): The dimensions thus taken, the casting up, and reducing feet into yards, is altogether the same as in Joiners work. Tables ready calculated for shewing, by inspection, the measurement of all such work you have in the second part hereof, to any dimension whatsoever, either in feet and inches, or square yards, &c. as may be required. The Painter usually reckons his work, once, twice, or thrice colour'd over; and in respect to the window-lights, window-bars, casements, and such like things, they do by the piece.

The following is an estimate of their several prices, according to the manner of the work :

Inside

| | £. | s. | d. |
|---|----|----|----|
| Inside and outside painting, three or four times in oil, per yard, from 6 d. to _____ | 0 | 0 | 8 |
| Painting second colour, and finishing, per yard _____ | 0 | 0 | 5 |
| Clear coaled and finished, per yard | 0 | 0 | 4 |
| Sash frames, three times in oil each | 0 | 1 | 0 |
| Sash squares, at per each - - - | 0 | 0 | 1 |
| Window-lights, three times in oil each _____ | 0 | 0 | 3 |
| Casements each _____ | 0 | 0 | 3 |
| Painting with olive-colour, at per yard _____ | 0 | 0 | 8 |
| With Prussian blue, at per yard - - | 0 | 0 | 10 |
| With greens, at per yard - - - | 0 | 1 | 0 |
| Modillion cornishes, from 6 d. per foot running, to _____ | 0 | 1 | 0 |
| Common outside cornishes, if single, per foot running _____ | 0 | 0 | 2 |

*The prices of colours, as sold at the
Colour-shops in London; and how
many square yards each colour
will paint.*

| | | | |
|---|---|----|---|
| First primer, ground in oil, at per 112 lb. weight _____ | 1 | 16 | 6 |

| Paving with nine-inch pammments, per yard - - - - - } | 0 | 2 | 8 |
| Workmanship only per yard for ditto | 0 | 0 | 6 |

Rates

Rates of materials, according to the prices in the preceding page.

Pebbles, at 20 s. per ton

Gravel, at 3 s. 6 d. per load

Rags, at 12 s. per ton

Flanders bricks, at 20 s. per thousand ;

so that, according as those vary in their rates, an allowance in the prices must be considered.

~~CHAP. VII. OF MASON'S WORK.~~

CHAP. VII.

Of MASON'S WORK.

MASONS measure their work sometimes by the foot solid, sometimes by the foot superficial ; and in some places, they measure their walling by the rood, of 21 feet long and 3 feet wide, which is 63 square feet ; prices of which, according to their workmanship and quality of the materials, are as follows, viz.

| | £. | s. | d. |
|--------------------------------------|----|----|----|
| Italian marble, black and white | 1 | 2 | 0 |
| vein'd, per foot cube | | | |
| Plain work on ditto, per foot super- | 0 | 3 | 3 |
| ficial | | | |
| Moulded work on ditto, per foot | 0 | 5 | 6 |
| superficial | | | |
| Slabs of ditto in chimney-pieces, at | 0 | 5 | 3 |
| per foot square | | | |

Purple

| | £. | s. | d. |
|--|----|----|----|
| Purple marble in slabs, at per foot square | 0 | 8 | 2 |
| Dove marble, at per foot superficial | 0 | 6 | 4 |
| Portland stone, measur'd when wrought, per foot cubical measure | 0 | 2 | 6 |
| Portland stone, streight, plain-work, per foot superficial | 0 | 1 | 0 |
| Circular ditto, plain, per foot superficial | 0 | 1 | 4 |
| Streight-moulded work ditto, per foot superficial | 0 | 1 | 2 |
| Circular-moulded work ditto, per foot superficial | 0 | 1 | 5 |
| Bath stone, measur'd when wrought in London, at per foot cube | 0 | 1 | 9 |
| Streight plain-work ditto, per foot superficial | 0 | 0 | 6 |
| Circular plain-work ditto, per foot superficial | 0 | 0 | 8 |
| Streight-moulded work ditto, per foot square | 0 | 0 | 7 |
| Circular-moulded work ditto, per foot ditto | 0 | 0 | 9 |
| Portland stone chimney-pieces, inch and half thick, per foot superficial | 0 | 1 | 6 |
| If 2 inches thick, per foot | 0 | 1 | 9 |
| Rygate fire-stone, hearth and covings, per foot superficial | 0 | 1 | 4 |
| Portland paving inch and half thick, per foot superficial | 0 | 1 | 6 |
| Ditto with black marble dots, per foot superficial | 0 | 1 | 10 |

30 *The GENTLEMAN and TRADESMAN'S*

C H A P. IX.

Of GLAZIERS WORK.

GLAZIERS measure their work by the foot square, so that the length and breadth of a pane of glass in feet, being multiplied into each other, produceth the content; and here it may be necessary to observe, that they usually take their dimensions to a quarter of an inch; and in multiplying feet, inches, and parts, the inch is divided into 12 parts as the foot is, and each part subdivided into 12, &c.

E X A M P L E.

Suppose a window having 8 panes of glass, and the depth of each pane to contain 10 inches, and 6 parts, the length of all the panes added together, make 8 feet 6 inches, how many feet of glazing are therein contained?

As the extent of these tables only reach to five feet square, you cannot have the whole length, therefore find the half thereof, viz. 4 feet 3 inches;

inches; which being done, look for your depth, viz. 10 inches and 6 parts; and opposite thereto, in the column of meeting, you will find

| f. | i. | p. |
|-------|----|----|
| 3 | 8 | 7 |

Of the Quality of Glafs.

The glafs which we use here in England, is that which is made at Newcastle and Woolidge. The size of those tables into which they make them, do contain about 5 foot; 45 of these tables do account for a case; the price of which is rather uncertain; for when coals are plenty, glafs is cheap; and when there is a scarcity of coals in London, then glafs is observed to be dearer; and notwithstanding coals are seldom scarce at Newcastle, yet, as they have no other conveyance so convenient for their glafs to London, than by the coal ships, it is oftentimes dearer on that account, than otherwise it would be;

be; sometimes at 30s. and at other times at 40s. the case; therefore if glass be worth so much whole, it must needs be still dearer when cut into squares or quarries.

Of the cutting of Glass.

To cut a case of glass into quarries, diamond fashion, (with halves, quarters, and three quarters of quarries, as the glass falls out) it is worth about 6s. 6d. or 7s. and this form improves the glass best, for that there is very little loss.

Of these quarries, there are different forms; some larger, some smaller; but the most general size, is 6 inches from angle to angle, one way, and 4 inches the other; and every quarry of this size, contain 12 inches; and consequently there should be 12 quarries in a foot, but between 10 and 11 (counting halves and quarters) do usually make a foot, the lead supplying the remainder; and a foot of this glass being banded and set up, 5d. and 6d. a foot is a usual rate; but in measuring, casements must be measured to the length and breadth of the iron; and oval windows (if any) must be measured as if they were square windows, of such a length and breadth, for that there is more trouble in them than in plain work. There is another sort of glass used here in England, which is called Normandy glass; of this glass, 25 tables make a case; it is thinner, clearer, and more transparent than the other, and is much dearer, and is commonly cut into long squares; the several prices of which, according

ording as buildings in general require, you have in the following estimates at large, viz.

First, Of Crown Glass.

As to the price of nails, hinges, latches, bolts, locks, &c. (which are almost innumerable) it not only would here be very tedious to give in particular, but also would be of very little use or satisfaction to any tradesmen, as it is well known to those who have occasion for any quantity, that they may have a catalogue from the wholesale Smiths, or Ironmongers, where they are sold, together with the very lowest prices thereof in general.

C H A P.

C H A P. XI.

Of squaring Dimensions.

THE method of squaring dimensions, or measuring the work of all artificers in general, relating to building, is chiefly perform'd by cross multiplication, being that familiar and necessary part of arithmetic, which every artificer whatsoever should endeavour to make himself perfectly acquainted with, notwithstanding we frequently find too many deficient therein; therefore, being so universally necessary, both to tradesmen, and the public in general, shall here, in the first place, lay down such instructions, as shall render the same easy and intelligible to the very meanest capacity, regularly exemplifying all the different branches relating to the works of the said artificers, both by X Multiplication at large, and also by inspectionary tables.

The GENERAL RULE.

Feet multiplied by feet, produce feet; feet multiplied by inches, produce inches; feet multiplied by parts, produce parts, every twelve being one inch; inches multiplied by inches, produce parts; inches multiplied by parts, produce seconds, every twelve being one part; parts multiplied by parts, produce thirds, every twelve being one second; by which it is necessary to observe, that twelve thirds make one second, and

twelve seconds make one first part; twelve first parts make one inch, and twelve inches make one foot; therefore twelve is a general divisor, and particularly to be observed in the method of squaring dimensions throughout.

The following examples are explained at large, in order to qualify the learner to perform the same arithmetically, viz.

E X A M P L E.

Let 7 feet 9 inches be multiplied by 3 feet 6 inches.

| f. | i. | p. | |
|---------|----|----|--------------------|
| 7 | 9 | | Length |
| 3 | 6 | | Breadth |
| <hr/> | | | |
| 23 | 3 | | product by 3 feet |
| 3 | 10 | 6 | ditto, by 6 inches |
| <hr/> | | | |
| Feet 27 | 1 | 6 | content |
| <hr/> | | | |

First, multiply 9 inches by 3, saying, 3 times 9 is 27, which make 2 feet 3 inches; set down 3 under inches, and carry 2 to the feet, saying, 3 times 7 is 21, and 2 that I carry makes 23; set down 23 under the feet: then begin with 6 inches, saying, 6 times 9 is 54 parts, which is 4 inches; set down 6 parts, and carry 4, saying, 6 times 7 is 42, and 4 that I carry is 46 inches, which is 3 feet 10 inches, which set down, and add all up together, and the product is 27 feet, 1 inch, 6 parts.

Let

E X A M P L E II.

Let 75 feet 7 inches, be multiplied by 9 feet 8 inches.

| | f. | i. | p. | |
|-------|-----|----|----|-------------------|
| | 75 | 7 | | Length |
| | 9 | 8 | | Breadth |
| <hr/> | | | | |
| | 680 | 3 | | product by 9 feet |
| | 50 | 4 | 8 | ditto by 8 inches |
| <hr/> | | | | |
| Feet | 730 | 7 | 8 | content |

First, multiply 9 feet, saying, 9 times 7 is 63, which is 5 feet 3 inches; set down 3, and carry 5, saying, 9 times 5 is 45, and 5 I carry is 50; set down 0, and carry 5, saying, 9 times 7 is 63, and 5 is 68; and proceed to multiply by 8 inches, saying, 8 times 7 is 56; the twelves in 56 is 4 times, and 8 remains; set down 8 in a place to the right hand, and carry 4; then multiply 75 by 8, which, divided by 12, the quotient is 50 feet, and 4 remains; set down 50 feet 5 inches, and add all up together, and you will find the product 730 feet, 7 inches, 8 parts.

E X A M P L E III.

A window is 6 feet 6 inches high, and 3 feet 4 inches broad, how many square feet glazing are there?

| | f. | i. | p. | |
|-------|----|----|----|---------------------|
| | 6 | 6 | | Length |
| | 3 | 4 | | Breadth |
| <hr/> | | | | |
| | 2 | 2 | 0 | product by 4 inches |
| | 19 | 6 | 1 | product by 3 feet |
| <hr/> | | | | |
| Feet | 21 | 8 | 0 | the answer. |

62 *The GENTLEMAN and TRADESMAN'S*

A cieling is 13 feet broad, and 17 feet 4 inches long, how many square yards doth it contain?

| | | |
|--------------|-----|-------------|
| f. | i. | |
| 17 | 4 | Long |
| | 13 | Broad |
| <hr/> | | |
| 9 | 225 | 4 |
| <hr/> | | |
| square yards | 25 | the answer. |

A floor is 24 feet 6 inches long, and 17 feet 6 inches broad, how many squares doth it contain?

| | | | | | |
|------------------|-------|----------|----------------------|-------|-----|
| | f. | i. | | f. | i. |
| Length | 24 | 6 | Length | 24 | 6 |
| Part of breadth | 0 | 10 | Remainder of breadth | 7 | 6 |
| | <hr/> | | | <hr/> | |
| | 245 | 0 | | 12 | 3 0 |
| | 183 | 9 | | 171 | 6 |
| | <hr/> | | | <hr/> | |
| Feet in a square | 100 | 428 | 9(4 squares | 183 | 9 0 |
| | <hr/> | | | <hr/> | |
| Feet | 28 | 9 inches | | | |

That is, 4 squares, 28 feet, and 9 inches.

Note, In the method of the above example, the breadth is divided into two parts, viz. the one, 10 feet, and the other, 7 feet 6 inches, which is 17 feet 6 inches, the products of which are added together, being much easier, when the breadth run large.

* * * See the same wrought at one operation hereafter.

E X A M-

E X A M P L E IV.

If a room be 27 feet 6 inches long, and 17 feet 6 inches broad, how many square feet are contained in that room?

The breadth divided into 10 feet, and 7 feet 6 inches; thus,

| | f. | i. | | f. | i. | p. |
|----------|-------|----|-------------|-------|----|----|
| Length | 27 | 6 | Length | 27 | 6 | |
| First by | | 10 | Secondly by | 7 | 6 | |
| | <hr/> | | | <hr/> | | |
| Added | 295 | 0 | | 13 | 9 | |
| | 206 | 3 | | 192 | 6 | |
| | <hr/> | | | <hr/> | | |
| Feet | 481 | 3 | | 206 | 3 | 0 |
| | <hr/> | | | <hr/> | | |

Answer, 481 square feet and 3 inches.

E X A M P L E V.

If a board be 9 feet 9 inches long, and 1 foot 4 inches and 6 parts broad, what is the superficial content of that board or plank?

| | f. | i. | p. | f. | i. | p. |
|---------|-------|----|----|----|----|-------------|
| Length | 9 | 9 | 0 | | | |
| Breadth | | | 1 | 4 | 6 | |
| | <hr/> | | | | | |
| | 0 | 4 | 10 | 6 | 0 | by 6 parts |
| | 3 | 3 | 0 | 0 | | by 4 inches |
| | 9 | 9 | 0 | | | by 1 foot |
| | <hr/> | | | | | |
| Feet | 13 | 4 | 10 | 6 | 0 | answer |
| | <hr/> | | | | | |

If

64 *The GENTLEMAN and TRADESMAN'S*

If a plank be 9 feet 5 inches 6 parts long, and 3 feet 4 inches and 5 parts broad, how many square feet are contained therein?

| | f. | i. | p. | f. | t. | |
|---------|----|----|----|----|----|--------------------|
| Length | 9 | 5 | 6 | | | |
| Breadth | | | 3 | 4 | 5 | |
| | 0 | 3 | 11 | 3 | 6 | product by 5 parts |
| | 3 | 1 | 10 | 0 | | ditto by 4 inches |
| | 28 | 4 | 6 | | | ditto by 3 feet |
| Feet | 31 | 10 | 3 | 3 | 6 | answer |

Answer, 31 feet, 10 inches, 3 parts, 3 seconds, and 6 thirds.

EXAMPLE VI.

If a room be 109 feet 6 inches round, and 12 feet 4 inches high, how many square feet are contained therein?

| | f. | i. | |
|--------|------|----|-----------------------|
| Length | 109 | 6 | |
| Height | 12 | 4 | |
| | 36 | 9 | 0 product by 4 inches |
| | 1314 | 0 | ditto by 12 feet |
| Feet | 1350 | 9 | 0 content |

Answer, 1350 feet 9 inches.

There is a roof cover'd with tiles, whose depth on both sides (with the usual allowance at the eaves) is 35 feet 6 inches, and the length

48 feet 9 inches, how many squares of tiling are contained therein, wrought by half the breadth, which is 17 feet 9 inches? thus,

| | f. | i. | p. | | f. | i. | p. |
|---------------------|------|----|----|-----------|-----|----|----|
| Length | 48 | 9 | | Length | 48 | 9 | |
| Part of the breadth | | 10 | | Remainder | | 7 | 9 |
| | 487 | 6 | | | 36 | 6 | 9 |
| | 377 | 9 | 9 | | 341 | 3 | |
| | | | | | 377 | 9 | 9 |
| Half content | 865 | 3 | 9 | | | | |
| Ditto added | 865 | 3 | 9 | | | | |
| Feet | 1730 | 7 | 6 | answer. | | | |

In the above method, the content is first found for half the breadth; which being doubled, as in the example, by addition, make 1730 feet, 7 inches, and 6 parts, equal to 17 squares, 30 feet, 7 inches and an half.

Of DIGGING.

THIS work is done by the cubic, or solid yard, containing 27 feet, or 3 feet every way, viz. in length and breadth.

E X A M P L E.

A cellar, or lower part of a building, is designed, that is 45 feet 8 inches long, 21 feet 6 inches wide, and 6 feet 8 inches deep, what number of yards is therein contained?

K

Length

56 *The* GENTLEMAN *and* TRADESMAN'S

| | f. | i. | p. | |
|---------------------|------|----|----|---|
| Length | 45 | 8 | | |
| Width | 21 | 6 | | |
| <hr/> | | | | |
| | 22 | 10 | 0 | } product by 6 inches, equal half of 45 feet 8 inches |
| | 49 | 0 | | } product by 21 feet |
| | 90 | | | |
| <hr/> | | | | |
| Feet | 97 | 10 | 0 | superficial content |
| Multiplied by depth | 6 | 6 | | |
| <hr/> | | | | |
| | 485 | 11 | 0 | product by 6 * inches ditto by 6 feet |
| | 583 | 1 | 0 | |
| <hr/> | | | | |
| Feet | 6316 | 11 | 0 | solid content |

* *Note*, When you have any large number of feet to multiply by 6 inches, the most easy method is to take half thereof, which both saves the trouble of multiplying and dividing the product by 12, as in this example above.

An Explanation of the following Tables,
adapted to measurement.

These tables consist of several columns, noted at the head of each of them with such figures as represent the length of any measurement in feet and inches, thus, 1 f. 1 i. 1 f. 2 i. 1 f. 3 i. &c. under which is written, in each column, the word Content; and under that, these letters, f. i. p. which signify the content in feet, inches, and parts of an inch, according to the said length given on the head of such column, and the breadth in the left hand column, numbered downwards, with 2, 3, 4, 5, &c. to 11 inches, from thence with 1, 2, 3 feet, &c. to the bottom of

of each table ; so that if you measure the length and breadth of any thing, and find the breadth in this column in the left hand side of each table, and the length at the head, the number which stands opposite in the common meeting of these two numbers, is the content thereof in feet and inches ; the use of which is hereafter made evident by various examples.

Of BRICK WORK.

To reduce Brick-work of any thickness, to the Standard thickness of one brick and an half.

This is the Rule :

Multiply the number of feet contained in the superficial content of the wall, by the number of half bricks that the wall is in thickness ; which product, divided by 3, the quotient is the true content of the brick-work required, reduced to the standard thickness of one brick and an half.

Note, When you measure two walls that constitute an angle, the length of one must be taken outside, the other on the inside ; also, in respect to chimneys, measure them as the solid wall, and deduct the vacancy between the jaumbs, and the mantle funnels are allowed solid, in regard to the trouble, and the pargetting the inside.

E X A M P L E.

Of the Reduction of Brick-work.

Suppose a wall (or the addition of several lengths of walling) to be 824 feet, and the

K 2

thick-

68 The GENTLEMAN and TRADESMAN'S

thickness of two bricks, how much reduced brick-work is therein?

| | |
|--|---|
| superficial content | 324 feet |
| Multiplied by the number of $\frac{1}{2}$ bricks | <u>4</u> |
| Divide by | |
| the number of $\frac{1}{2}$ bricks in the standard | $\left. \begin{array}{l} \text{ } \\ \text{ } \end{array} \right\} 3) 1296 (432 \text{ feet reduced}$ |
| | <u>12</u> |
| | .9 |
| | <u>9</u> |
| | .6 |
| | <u>6</u> |
| | . |

To bring reduced feet into rods, this is the rule.

Divide the number of feet (reduced as above) by the number of square feet in a rod, that is, $272 \frac{1}{4}$; but as this is always used for a divisor, the fractional part $\frac{1}{4}$, is commonly omitted; as the value thereof, even in a large number of feet, would scarcely be material.

Example as above.

| | | |
|--------------------|-------------------|----------------------------------|
| feet in a rod is | $16 \frac{1}{2}$ | number of feet to be divided, is |
| Multiplied | $16 \frac{1}{2}$ | r. q. f. |
| | <u>96</u> | 272)432(1 2 24 |
| | 16 | <u>272</u> |
| for the parts | $16 \frac{1}{4}$ | *68)160)2 qrs. facit |
| divisor | $272(\frac{1}{4}$ | <u>136</u> |
| or sq. f. in a rod | | remains 24 feet |

* Note 68 feet is a quarter of a rod; thus,

| |
|---------------|
| 4)272(68 feet |
| <u>24</u> |
| 32 |
| <u>32</u> |
| . |

This last example may be sufficient to shew the true method of reducing brick-work of any thickness, to the standard thickness of one brick and an half thick; and also to give the content (when so reduced) in rods, &c.—But whereas I have calculated tables, in the first part of this book, which readily gives the content of any dimensions hereof, ready reduced, there will be little need of taking so tedious a method as this, unless it be those who are somewhat already acquainted with figures, and choose to satisfy themselves with the nature and reason thereof, which, in such case, undoubtedly is very necessary.

How to perform the measurement of Brick-work, by the following Tables.

E X A M P L E I.

If a brick wall be 40 feet long, 9 feet 11 inches high, and $1\frac{1}{2}$ brick thick, how many rod and feet doth it contain?

Look for that table on which it hath on the head, 40 feet, (the length of the wall) which being done, seek in the left hand column for 9 feet 11 inches, (the height thereof) first taking 9 feet, guiding your finger on the same line, till you come to that column whereon it hath 40 feet at head, where you will find 360 feet; in like manner seek the 11 inches, (the remainder of the height) and you will find 36 feet 8 inches, which being added, make

| f. | i. |
|-------|----|
| 360 | |
| 36 | 8 |
| <hr/> | |
| 396 | 8 |

the content thereof in feet

70 The GENTLEMAN and TRADESMAN'S

which, to bring into rods, &c. you have been shewn in the former example; otherwise, refer to the reduced tables in the first part, where you will find the number of rods therein contained.

The proof by Multiplication.

| | f. | i. | p. | |
|---------------|------|-----|--------|--------------|
| Length | 40 | 0 | | |
| Height | | 9 | 11 | |
| | 36 | 8 | 0 | |
| | 360 | 0 | | |
| | | | | r. qr. f. i. |
| feet in a rod | 272 | 396 | 8 0 | (1 1 56 8 |
| | 272 | | | facit |
| | 68 | 124 | (1 qr. | |
| | 68 | | | |
| | feet | 56 | | |

EXAMPLE II.

A piece of Tiling is 40 feet long, and 10 feet 6 inches broad, how many squares are therein contained?

Seek as before directed for the table of your length, viz. 40 feet; then find the breadth, 10 feet, in the left-hand column, for which you will find, in the common meeting of the said length and breadth, 400 feet; then seek 6 inches (the complement of the breadth) for which you will find 20 feet; these added together, make 420 feet, the content thereof, which, to bring into

into squares, is only cutting off the 20; and the 4 so cut off on the left hand side, is 4 squares, and the 20 on the right, are remaining feet, and equal to 1-5th part of a square more, thus,

4||20 equal to 4 squares and 20 feet;

or thus, if you can divide,

$$\begin{array}{r} \text{feet in a square } 100 \overline{) 420} (4 \text{ squares, } 20 \text{ feet} \\ \underline{400} \\ 120 \text{ feet} \end{array}$$

See the proof by Multiplication underneath.

The proof.

| | f. | i. | p. | |
|------------|------------|----------|----------|----------------------------|
| Length | 40 | 0 | | |
| Breadth | 10 | 6 | | take half 40 for 6 inches |
| | <u>20</u> | <u>0</u> | <u>0</u> | which here is 20 feet |
| | 400 | 0 | | product by 10 feet |
| content f. | <u>420</u> | <u>0</u> | | divided by 100 for the sq. |
| | | | | thus, |

$$1||00 \overline{) 420} ($$

equal 4 squares 20 feet, as required.

EXAMPLE III.

How many squares are there in a piece of tiling?

the length being 50 feet
and breadth 30 feet

$$\begin{array}{r} \text{squares } 15||00 \\ \text{facit.} \end{array}$$

Of CARPENTERS WORK.

TO measure the body of a timber building, take the length of one side and one end, and add them together, and multiply that sum by the height, (taken from the under-side of the cill, to the upper-side of the rising) gives the content of one side and one end; which, being doubled, give the content of the whole body of the building in feet.

EXAMPLE.

If a timber building be 35 feet 6 inches long, 18 feet 3 inches broad, and height of the building 19 feet, how many squares of framing are therein contained?

By Multiplication.

| | f. | i. |
|---------------|----|----|
| Length | 35 | 6 |
| Breadth | 18 | 3 |
| Product added | 53 | 9 |

| | | |
|----------------------|--------------|-------------------|
| Multiplied by height | 19 f. xd. by | $\frac{19}{9}$ is |
| feet | 1021 | 3 |
| doubled, or xd. by | | 2 |
| Divide by 100 } | 20(42 | 6 |
| is } | sq. f. | i. |
| | | $\frac{51}{48}$ |
| | | 3 inches |

content of the two sides and ends, or whole building.

Or

Or by this method, which is much easier;

Divide the height into $\begin{matrix} f. & i. \\ 10 & \text{and } 9 \end{matrix}$ which equal 19 feet and proceed thus by two operations.

| | f. | i. | | f. | i. |
|--------------------------|-------|----|------------------|-------|----|
| Length and breadth added | 53 | 9 | Ditto | 53 | 9 |
| Part of the height | | 10 | Remaining height | | 9 |

| | <hr/> | | | | |

whole content as above, } 20 | 42 6 equal to 20 squares, 42 feet, 6 inches.
is - - - - -

By the Tables,

The product of the length and breadth, here added, is 53 feet 9 inches, which exceed the extent of those tables; therefore it will be necessary for the reader to observe the following method: first, to take the table

| | f. | i. | |
|------|-------|----|--------|
| | 33 | 9 | length |
| and | 20 | | ditto |
| | <hr/> | | |
| feet | 53 | 9 | |

which, together, make the required product, viz. 53 feet 9 inches; and so proceed; first, with 20 feet 9 inches. Having in this table found the breadth 19 feet, you will find the content to be 380 feet; then proceed to table 33 feet length, and for the said breadth 19 feet,

L

yo.1

74 *The GENTLEMAN and TRADESMAN'S*

you will find 627 feet; but whereas, the odd 9 inches belonging to this table, is wanting, you must take (according to the rule) 3 parts of 19 feet, (the height) which is 14 feet 3 inches; and these being added together, and doubled, will make 2042 feet 6 inches, as before; thus,

| | f. | i. | | f. | i. |
|------------|----|----|-------|---------|-------------|
| Table | 33 | 9 | long | 641 | 3 |
| Table | 20 | | ditto | 380 | 0 |
| the height | 53 | 9 | is | 10 21 | 3 as before |

| | | | |
|--------------------|-----|----|----|

| Answer | 10 | 21 | 3 |
| which doubled, | 10 | 21 | 3 |
| make as required } | 20 | 42 | 6 |

E X A M P L E.

A floor is 24 feet 6 inches long, and 17 feet 6 inches wide, how many squares doth it contain?

| | f. | i. | p. | |
|--------|--------|----|----|--|
| Length | 24 | 6 | | |
| Width | | 17 | 6 | take half 24 feet 6 inches, for 6 inches |
| | 12 | 3 | 0 | the product |
| | 176 | 6 | | product by 17 feet |
| | 240 | 0 | | |
| feet | 4 28 | 9 | 0 | content in feet |

Answer 4 squares, 28 feet, 9 inches.

Note, You may divide the width, 17 feet 6 inches, into 9 feet, and 8 feet 6 inches, and work at two operations, as before.

Of ROOFING.

IT is usually a rule amongst workmen, that the flat of any house, and half the flat thereof, (taken within the walls) is equal to the measures of the roof of the same house; but this is, when the roof is true pitched; for if the roof be more flat, or steep, than the true pitch, it will consequently measure more or less.

E X A M P L E I.

If a house within the walls be 46 feet 9 inches long, and 20 feet 6 inches broad, how many squares of roofing will cover that house?

R U L E.

Multiply the length and breadth together, and the product is the number of feet contain'd in the flat; then take the half thereof, and add to the flat; that sum divided by 100, is the number of squares contained therein.

E X A M P L E II.

| | f. | i. | p. | | | | |

L 2

E X A M -

E X A M P L E III.

Suppose a four-pannel square door be 5 feet 1 inch in height, and 3 feet 4 inches broad, how many feet doth that door contain?

Having found the table agreeable to your height, 5 feet 1 inch, look for the width thereof, 3 feet 4 inches; opposite which, in the common meeting of the said numbers, you will find as follows, viz. for 3 feet, 15 feet 3 inches; and for 4 inches, 1 foot 8 inches and 4 parts, which, being added together, make 16 feet 11 inches and 4 parts, the content thereof; thus,

| | f. | i. | p. |
|-----------------------------|----|----|----|
| content for 3 feet in width | 15 | 3 | 0 |
| ditto for 4 inches ditto | 1 | 8 | 3 |
| content in square feet | 16 | 11 | 3 |

The proof by Crofs Multiplication.

| | f. | i. | p. | |
|---------|----|----|----|---------------------|
| Length | 5 | 1 | | |
| Breadth | 3 | 4 | | |
| | 15 | 3 | | content by 3 feet |
| | 1 | 8 | 4 | content by 4 inches |
| feet | 16 | 11 | 4 | content required |

Or thus, by a second method.

| | f. | i. | p. | |
|---------|----|----|----|---------------------|
| Length | 5 | 1 | | |
| Breadth | | 3 | 4 | |
| | 1 | 8 | 4 | content by 4 inches |
| | 15 | 3 | | content by 3 feet |
| feet | 16 | 11 | 4 | content required |

The foregoing examples, together with the former directions, being well observed, may enable the reader to find the content of any dimensions almost whatsoever required, if the said length and breadth of such given dimension, do not exceed the extent of these tables, which, if so, will require a little more difficulty; but shall, hereafter, make it even then easily to be understood by a few examples; therefore, shall give a few more in this place, for practice in the common way.

EXAMPLE IV.

Suppose a boarded floor, or cieling, wainscot of a room, &c. be in length 24 feet, and in breadth 18 feet 9 inches, how many feet, inches, and parts, are therein contained?

First, look for the table expressing your length, viz. 24 feet, in which seek your breadth, 18 feet 9 inches, and you will find, opposite 9 inches, the content to be 18 feet; and opposite 18 feet, the content to be 432 feet, which, being added, make 450 feet, the content required.

Proof by Cross Multiplication.

| | | | | | |
|---------|-----|----|----|---------------------|-----------|
| | f. | i. | p. | | 24 |
| Length | 24 | 0 | } | | 9 |
| Breadth | 18 | 9 | | memorandum by 9 | — |
| | 432 | 0 | | | 12)216(18 |
| | 18 | 0 | 0 | content by 18 feet | 12 |
| | | | | content by 9 inches | — |
| feet | 450 | 0 | 0 | content required. | 96 |
| | | | | | 96 |

By

78 *The GENTLEMAN and TRADESMAN'S*

By a second method.

| | f. | i. | p. | |
|---------|-----|----|----|---------------------|
| Length | 24 | 0 | 0 | |
| Breadth | 18 | 9 | | |
| | 18 | 0 | 0 | content by 9 inches |
| | 432 | 0 | 0 | content by 18 feet |
| Feet | 450 | 0 | 0 | content required. |

By these directions, all dimensions of moderate extents, may be squar'd with ease, to the greatest exactness: and when the nature of the work require the content in square yards, such as painting, plastering, &c. it is only dividing the said content by 9, the feet in a square yard, and the quotient is the answer. One example may be sufficient to instruct any person deficient therein.

Example of the above:

feet in a square yard } 9)450(50 content in yds as req.

$$\begin{array}{r} 45 \\ \hline 0 \end{array}$$

N. B. In Carpenters work, flooring, partitioning, and roofing, are commonly measured by the square of 10 feet long, and 10 feet wide; so that 1 square contains 100 square feet. The method of finding the number of squares in any number of feet, is only dividing by 100, and the quotient is the answer; which suppose the

above,

above, thus, 100)450(4 squares and 50 feet, equal to $\frac{1}{2}$ square; or by cutting off the two cyphers, thus, 1||00)4(50, that is, 4 squares and 50 feet over, which is equal to half a square more; and so of any larger number. See more examples hereafter.

EXAMPLE V.

Suppose a room be 20 feet long, and 11 feet 6 inches broad, how many square feet are contained therein?

Seek for the table of 20 feet long, according as before directed; which being done, look down the same column, till you come opposite 11 feet, the breadth, and you will find 220 feet; and for 6 inches, (the remainder of the breadth) you will find 10 feet, which being added to the former, make 230 feet, the full superficial content requir'd.

The proof.

| | f. | i. | p. | |
|---------|-------|----|----|--------------------|
| Length | 20 | 0 | 0 | |
| Breadth | 11 | 6 | 0 | |
| | <hr/> | | | |
| | 220 | 0 | 0 | content by 11 feet |
| | 10 | 0 | 0 | ditto by 6 inches |
| | <hr/> | | | |
| Feet | 230 | 0 | 0 | content required. |

EXAMPLE VI.

Suppose the compass round a room measure 50 feet, and the height 9 feet 6 inches, how many feet are contained therein?

Compass

80 *The GENTLEMAN and TRADESMAN'S*

| | f. | i. | p. | |
|---------|-----|----|----|---|
| Compass | 50 | 0 | 0 | |
| Height | 9 | 6 | 0 | |
| | 25 | 0 | 0 | for 6 i. being the $\frac{1}{2}$ of 50 f. |
| | 450 | 0 | 0 | for 9 feet |
| Feet | 475 | 0 | 0 | content requir'd. |

The reader is desired also to observe, that notwithstanding these tables are not calculated any further than 20 feet in length, by every single inch, yet all dimensions in the common way, may be squared within this compass; and in respect to business of greater extent, the remaining tables of 1 foot each, will be found sufficient to solve any that may be requir'd, at pleasure. An example or two, for practice, will make it appear very easy, if properly observ'd, which suppose as follows, viz.

Length 100 feet, and breadth 37 feet 10 inches, what is the content in square feet.

First, seek the table nearest to agree with your length, which is that of 50 feet (being the last table); next, seek out your breadth, which is 37 feet 10 inches, for which you will find, for 10 inches 41 feet, 8 inches content; and for 37 feet, 350 feet content; and for 30 feet, (the complement of your breadth) 1500 feet in content, which, being all added, make the true content for 50 feet in length, thus, as in the following page.

Content

| | f. | i. |
|------------------------------|------|----|
| Content of 30 feet | 1500 | |
| content of 7 feet | 350 | |
| content of 10 inches | 41 | 8 |
| content of 37 feet 10 inches | 1891 | 8 |

And whereas, your dimension was required for 100 feet in length, you must double this content, and the product is the content requir'd, viz. for 100 feet in length; for twice 50 is 100, thus,

| | f. | i. |
|-----------------------------------|------|----|
| content of 50 feet long | 1891 | 8 |
| content of 50 ditto | 1891 | 8 |
| content of feet, 100, as requir'd | 3783 | 4 |

or thus, if you can multiply;

| | f. | i. |
|--|----|----|
| 1891 8 content of 50 feet long | | |
| by 2 | | |
| 3783 4 content as required for 100 feet. | | |

Example of the proof by Cross Multiplication.

| | f. | i. | p. |
|---------|------|----|----|
| Length | 100 | 0 | |
| Breadth | 37 | 10 | |
| | 700 | 00 | |
| | 300 | 00 | |
| | 3783 | 40 | |
| Feet | 3783 | 40 | |

M There

There is, in the next place, a necessary point to explain to the reader, in respect to the inches wanting in the tables, viz. between those of 20 and 50 feet in length, which increase 1 foot at each step; therefore, where there are inches included with the feet, as commonly is the case in most dimensions promiscuously taken, (in lengths as well as breadths) it will sometimes perhaps happen, that such lengths as are required, cannot exactly be found here, as in the former part of these tables of feet and inches, which, without some method laid down to facilitate the same, the reader, no doubt, would find some difficulty; therefore it will be very necessary to observe the following directions, viz. When the exact length can only be found, agreeable in feet with your given dimension, but deficient in the inches, observe

2001 This RULE.

If the number of inches deficient in length, be 1, add 1-12th part of the given breadth to the product; if 2, add 1-6th; if 3, add 1-4th; if 4, add 1-3d; if 6, add 1-half; if 9, add 3-4ths: as for the rest, or intermediate inches, 5, 8, 10 and 11, they may easily be imagined to the least difference possible.

Note, That the inches in the breadth will never be found deficient.

EXAMPLE.

Suppose the length be 38 feet 6 inches, and breadth 27 feet 9 inches, what is the content in feet, inches, and parts?

The table of 38 feet long, following, agrees with your length in feet, but in inches, deficient, therefore seek your breadth, 27 feet 9 inches, (the contents for which, are as follows) viz. for 9 inches, 28 feet 6 inches; for 7 feet, 266 feet, and for 20 feet, 760 feet, which added, make 1054 feet 6 inches; then for the 6 inches wanting in length, (according to the former directions) take half of the breadth, 27 feet 9 inches, which is 13 feet, 10 inches, 6 parts; which, added to the above, make 1068 feet, 4 inches, 6 parts, the content required.

The proof by Cross Multiplication.

| | f. | i. | p. | |
|---------|------|----|----|----------------------|
| Length | 38 | 6 | | breadth |
| Breadth | 27 | 9 | | |
| | 269 | 6 | | } content by 27 feet |
| | 77 | | | |
| | 28 | 10 | 6 | content by 9 inches |
| feet | 1068 | 4 | 6 | content required. |

These two last methods will only be requir'd, when the work run to considerable extents in the dimensions, which seldom happen in the common course of business.

E X A M P L E.

Suppose a door be 6 feet 4 inches high, and 3 feet 9 inches broad, how many feet doth that door contain?

M 2

Length

84 The GENTLEMAN and TRADESMAN'S

| | f. | i. | p. | |
|--------------|-------|----|----|-------------|
| Length | 6 | 4 | | |
| Breadth | 3 | 9 | | |
| | <hr/> | | | |
| | 19 | 0 | | by 3 feet |
| | 4 | 9 | 0 | by 9 inches |
| | <hr/> | | | |
| content feet | 23 | 9 | 0 | required. |

E X A M P L E.

Suppose a floor be 57 feet 3 inches long, and 28 feet 6 inches broad, how many squares of flooring are therein?

| | f. | i. | p. |
|--|-----------------|----|-----|
| Length - - - - - | 57 | 3 | |
| Half the breadth - - - | | 14 | 4 |
| | <hr/> | | |
| Product by 4 inches - | 19 | 1 | 0 |
| Ditto by 14 feet - - - } | 23 ¹ | 6 | |
| | 57 | | |
| | <hr/> | | |
| Half content - - - | 820 | 7 | 0 |
| Multiply by - - - | | | 2 |
| | <hr/> | | |
| Content feet - - - | 16 ¹ | 41 | 2 0 |
| Answer, 16 squares, 41 feet, 2 inches. | | | |

Note, In the above example, the breadth is divided into half; therefore that content being doubled, (or multiplied by 2, as is here) the product is the answer, which method may occasionally be used, as it will save much trouble in the work.

Of PLAISTERERS WORK.

A Cieling is 14 feet broad, and 17 feet 6 inches long, how many yards doth it contain?

Seek for the table agreeable to your length, viz. 17 feet 6 inches; which being done, you will find, for 14 feet in breadth, 245 feet, which, to bring into square yards, you must divide by 9, the number of feet in a square yard; or if you cannot divide, you may find 245 in the last table in this book, adapted for this purpose, where you will have your desire by inspection.

Note, It will sometimes fall out, that you cannot find the exact number you want in the said table; but, if you take the nearest thereunto, not exceeding, you will have the number of square yards therein, and the deficiency is remaining feet, as in the above example; the nearest number to 245, is in the table thus distinguished a * 243, the square yards in which is 27, so that the difference between the said numbers being only 2, they are remaining feet, over and above 27 square yards, as required.

| | 925 | 0 | | 475 | 0 | 0 |
| content is - | | | Feet | 475 | 0 | 0 |
| divided by 9 is yds. | 103 | 7 | feet | | | |

facit

Which you may prove as ufual by the tables.

90 *The GENTLEMAN and TRADESMAN'S*

A Painter hath painted a large hall, the height whereof is 23 feet, and is 120 feet about, how many square yards of painting is therein contained?

Length (or round) about the hall is

| | |
|-------------|--------------------------------------|
| | feet |
| in compass. | 120 |
| in height | 23 |
| | <hr style="width: 50%; margin: 0;"/> |
| | 360 |
| | 240 |
| | <hr style="width: 50%; margin: 0;"/> |
| | 9)2760(306 yds. 6 feet, as required. |
| | 27 .. |
| | <hr style="width: 50%; margin: 0;"/> |
| | .. 60 |
| | 54 |
| | <hr style="width: 50%; margin: 0;"/> |
| | .6 |
| |) |

To perform the same by the table, proceed thus:

The compass of the hall exceeding the tables, the best method will be, to work by table 40 feet in length, which, being tripled on 3 times, added, will make just 120, the required number; therefore, in the said table, opposite the height 20 feet, you will find 800; and for 3 feet, 120 feet, which make 920 feet, the triple of which is 2760 feet as above.

Of

Of GLAZIERS WORK.

| | <hr/> | | | |

EXAMPLE II.

A Glazier hath glazed a window, containing 8 panes of glass, the depth of each pane being 2 feet 5 inches, and the length of the 8 panes together are 13 feet, how many feet of glazing are contain'd in that window?

| | f. | i. | p. | |
|--------------|-------|----|----|---------------------|
| Length | 13 | 0 | | |
| Breadth | | 2 | 6 | |
| | <hr/> | | | |
| | 5 | 5 | 0 | product by 5 inches |
| | 26 | 0 | | ditto by 2 feet |
| | <hr/> | | | |
| content feet | 31 | 5 | 0 | answer. |
| | <hr/> | | | |

Collect the tables according to the above dimensions, and you will find the content as above.

E X A M P L E III.

There are 8 panes of glaſs, each 4 feet 7 inches and 9 parts long, and 1 foot 6 inches 4 parts broad, how many feet of glaſs are contained in the ſaid 8 panes?

| | f. | i. | p. | |
|--------------|----|----|----|----------------------|
| Length | 4 | 7 | 9 | |
| Breadth | 1 | 6 | 4 | |
| | 4 | 7 | 9 | product by 1 f. |
| | 2 | 3 | 10 | 6 ditto by 6 i. |
| | 0 | 1 | 6 | 7 0 ditto by 4 parts |
| Feet | 7 | 1 | 2 | 1 0 content 1 pane |
| | | | | 8 numb. of panes |
| content feet | 56 | 9 | 4 | 8 0 of the whole p. |

Or thus, by the Tables:

After you have found the content of 1 pane, which as above is 7 feet 1 inch, (the parts not being material) find the table of 8 feet long (the number of all the panes); and opposite the other number, 7 feet 1 inch, you will find thus; for 7 feet, 56 feet; and for 1 inch, 8 inches (being the half of 2 inches); which added, make 56 feet 8 inches, only differing (on account of the parts being omitted) 1 inch from the above method.

If

If a pane of glafs be 4 feet 9 inches long, and 3 feet 2 inches broad, how many feet are contain'd therein?

By Multiplication.

| | f. | i. | p. | |
|--------------|----|----|----|---------------------|
| Length | 4 | 9 | | |
| Breadth | | 3 | 2 | |
| | 0 | 9 | 6 | product by 2 inches |
| | 14 | 3 | | ditto by 3 feet |
| content feet | 15 | 0 | 6 | as required. |

By the table of 4 feet 9 inches in length, you will find as follows, viz.

| | f. | i. | p. | |
|-------------------------|-----|----|----|----------|
| For 3 feet broad | - | 14 | 3 | |
| for 2 inches ditto | - - | 0 | 9 | 6 |
| which together is, feet | 15 | 0 | 6 | as above |

Note, To those who are not expert in casting up, or valuing any number of feet, yards, squares, &c. (at such a given price) shall refer them to the valuing table hereafter contained, being ready calculated for their use, to any number or price.

E X A M P L E.

Suppose a window to contain 8 panes of glafs, the depth of each pane to measure 10 inches and 6 parts, and the length of all the panes added together, 8 feet 10 inches, how many feet of glazing is in that window?

Note,

Note, As the extent of these tables only reach to 5 feet square, the length here required cannot be found, therefore you must take half thereof, which is 4 feet 5 inches; which being found at the head of the table, look down the same column, till you come opposite the given depth of the pane, viz. 10 inches 6 parts, and you will find 3 feet 10 inches and 4 parts, which is half the content required; therefore must be doubled, and it will make 7 feet, 8 inches, 8 parts, the content of that window.

| The proof | | | | | |
|-----------|----|----|------|----|----|
| | f. | i. | p. | f. | t. |
| Length | 8 | 10 | 0 | | |
| Depth | | | 0 10 | 6 | |
| <hr/> | | | | | |
| | 0 | 4 | 5 | 0 | 0 |
| | 7 | 4 | 4 | 0 | |
| <hr/> | | | | | |
| Feet | 7 | 8 | 9 | 0 | 0 |
| | f. | i. | p. | f. | t. |
| <hr/> | | | | | |

content required.

E X A M P L E II.

Suppose a window contain 12 panes, which added together, make 15 feet 9 inches in length, the depth of each pane 2 feet, 10 inches, and 6 parts, how many feet of glazing are therein contained?

In the preceding tables, first look out for the length thereof at the head, viz. 15 feet 9 inches; then looking down the same column, till you come opposite to the depth, 2 feet, you will find
31 feet

31 feet 6 inches; and for 10 inches, 13 feet 1 inch 6 parts; which being added, make 44 feet 7 inches 6 parts; as to the 6 parts, (which is yet wanting in the depth) you may take 1-4th part from the content of 2 inches, (the first breadth in the table) which here is 2 feet 7 inches 6 parts; the 4th part of which will be 7 inches 10 parts more; which being added to the above, make 45 feet 3 inches 4 parts, the content required, thus,

| | | | | f. | i. | p. |
|------------------|---|----|---------------|-------|----|--------------|
| Content for | 2 | | feet depth | 31 | 6 | 0 |
| Ditto for | 0 | 10 | inches ditto | 13 | 1 | 6 |
| Ditto for | 0 | 0 | 6 parts ditto | 0 | 7 | 10 |
| <hr/> | | | | <hr/> | | |
| Whole depth feet | 2 | 10 | 6 | 45 | 3 | 4 cont. req. |

By a due observation of these examples, it will appear very easy to square any work of the like nature; notwithstanding, to render the same more intelligible, I have found out a method which will greatly facilitate the nature of squaring all such measurements, as consist of any number of parts, either in length or breadth, being all contain'd in the following table, and explain'd to the meanest capacity, by such necessary examples, as will sufficiently qualify the learner to perform the same to the nearest exactness possible, being a work which far exceedeth any thing of the like nature; for by this table, all small dimensions contained within an inch measure, either in length or breadth, may be found, by inspection, from 1 inch, to the extent of 50 feet square.

Expla-

Explanation of the last Table.

This Table consisteth of 12 columns, numbered on the head with 2, 3, 4, 5, &c. signifying the parts of an inch, (excepting the first column on the left hand, which contain the number of the lengths or breadths of any measurement) as hereafter will be made more intelligible, by the following examples.

E X A M P L E I.

Let it be required to multiply 3 feet 9 inches in length, by 9 parts of an inch in breadth.

Look for that column which hath on the head thereof, 9 parts; then guiding your finger down that column, till you come opposite 9 inches (belonging to your length) in the left hand column, and you will find 7 parts of an inch; then going down the same column, till you come opposite 3 feet, (the remainder of your length) and you will there find 2 inches and 3 parts; which being added to the former 7 parts, make 2 inches and 10 parts, the content thereof.

The Proof.

| | f. | i. | p. | f. |
|---------|-------|----|----|------------|
| Length | 3 | 9 | | |
| Breadth | | 0 | 0 | 9 |
| | <hr/> | | | |
| feet | 0 | 2 | 19 | 9 content. |
| | | | 9 | |
| | <hr/> | | | |

Note, The 3 seconds (which here exceedeth that in the tables) is of so trifling a value, that I shall

shall not take notice thereof; having calculated the said table no further than parts of an inch, which is as near as any work require.

E X A M P L E II.

Suppose the length of any measurement to be 12 feet 7 inches, and the remainder of any breadth (thereunto belonging) be 11 parts of an inch, what is the content in feet, inches, and parts?

According to the former direction, seek first, the column which hath on the head thereof, 11 parts; then look down the same, until you come opposite 7 inches, (belonging the length) and you will find 6 parts of an inch; and opposite 12 feet, (the complement of the length) you will find 11 inches; which together, make 11 inches and 6 parts, the content thereof.

The proof.

| | f. | i. | p. | f. | t. |

| Length | 12 | 7 | 0 | | |
| Breadth | | | 0 | 0 | 11 |
| | <hr/> | | | | |
| feet | 0 | 11 | 6 | 5 | 0 |
| | <hr/> | | | | |

These examples will, I presume, be sufficient to shew the great utility of the said table; yet it may not be unnecessary to acquaint the reader, That whereas, the ensuing tables do only measure by the length and breadth given in feet and inches, which in most cases is sufficient; yet this
table

table will find the content of the remaining parts of an inch, when it so falls out, to any length or breadth required.

How to find the value of all such parts of an inch, as may pertain to either length or breadth, in order to supply the following tables, whensoever found deficient therein.

E X A M P L E.

Suppose the length of any measurement to be 10 feet 9 inches and 6 parts; and the breadth, depth, or height, be 7 feet 6 inches and 9 parts, how many square feet are contained therein?

By the following tables, as before directed, first, find out that agreeable to your length, viz. 10 feet 9 inches; which being done, seek your breadth in the left hand column, viz. first, 7 feet; opposite which, you will find 75 feet 3 inches; and in the same column, opposite 6 inches, (the remaining part of the breadth) you will find 5 feet 4 inches and 6 parts; which added, make 80 feet 7 inches and 6 parts. Now whereas these tables measure no nearer than inches, the remaining parts, belonging the length and breadth, is yet wanting; in order to obtain which, observe the following rule: In the foregoing table of parts, (design'd and adapted for this purpose) seek for 9 parts, pertaining your breadth, on the head thereof; and in the same column, under that pointing downwards, till you come opposite 10 feet, (the length) in the left hand column, you will find 7 inches 6 parts; and

and for the remainder of the length, viz. (9 inches) you will find 7 parts; which added, is 8 inches 1 part; then find 6 parts belonging the length, on the head of the table, and seek the breadth, 7 feet, on the left hand column; opposite to which, you will find 3 inches 6 parts; which, added to the above 8 inches 1 part, make 11 inches 7 parts—the measure of all the parts; this being added to the first measurement, viz. 80 feet, 7 inches, 6 parts, make 81 feet, 7 inches, 4 parts, the whole content of the said measurement.

The proof.

| | f. | i. | p | f. | t. |
|---------|----|----|---|----|----------------|
| Length | 10 | 9 | 6 | | |
| Breadth | | | 7 | 6 | 9 |
| | 0 | 8 | 1 | 1 | 6 |
| | 5 | 4 | 9 | 0 | |
| | 75 | 6 | 6 | | |
| feet | 81 | 7 | 4 | 1 | 6 content req. |

Note, The second and third parts are inconsiderable.

Of MASONS WORK.

MASONS measure all their work by the foot, either superficial or solid, and therefore I need give no example in this kind of work; for the rules before delivered, (together with the table of solid measure therein contained)

tained) are sufficient to perform any thing that in Masonry is required; however, shall give one example for practice.

E X A M P L E.

If a wall be 47 feet 6 inches long, 16 feet 3 inches high, and 2 feet 3 inches thick, how many solid feet are contained therein?

| | f. | i. | p. | f. | |
|-----------------------------|------|----|----|----|---|
| Length - - - | 47 | 6 | | | |
| Height - - - | 16 | 3 | | | |
| | 290 | 0 | | | } product by 16 feet ditto by 3 inches |
| | 47 | | | | |
| | 11 | 10 | 6 | | |
| Superficial content - - - | 771 | 10 | 6 | | |
| Multiplied by the thickness | 2 | 3 | 0 | | |
| Product - - - - - | 192 | 11 | 7 | 6 | by 3 inches |
| Ditto - - - - - | 1543 | 9 | 0 | | by 2 feet |
| Solid content - - - - | 1736 | 8 | 7 | 6 | facit |
| | f. | i. | p. | f. | |

Note, When your work requires bringing into solid yards, divide the number of feet by 27, the feet in a solid yard; obtain'd thus,

3 times 3 is 9, and 3 times 9 is 27;

$$\begin{array}{r}
 3 \\
 3 \\
 \hline
 9 \\
 3 \\
 \hline
 27 \text{ feet.}
 \end{array}$$

Of

Of PAVIOURS WORK.

IF a pavement be 40 feet 6 inches long, and 16 feet 6 inches broad, I demand how many yards are contained therein?

thus, by the breadth divided,

| | f. | i. | | f. | i. | p. |
|-----------------|------------|----|-----------------------------------|-----------|----|----|
| Length - - - | 40 | 6 | Ditto - - - - - | 40 | 6 | |
| Breadth in part | 8 | | Remainder ditto | 8 | 6 | |
| Product by 8 f. | <u>324</u> | 0 | | <u>20</u> | 3 | 0 |
| | | | | 324 | 0 | |
| | | | product by 8 feet 6 inches | 344 | 3 | 0 |
| | | | product by 8 feet added - - - - - | 324 | 0 | 0 |
| | | | divided by - - - | 9)668 | 3 | 0 |
| | | | 74 yards, 2 feet, 3 inches | 74 | 2 | 3 |
| | | | facit. | | | |

E X A M P L E II.

There is a room, whose length is 21 feet 6 inches, and the breadth 17 feet 6 inches, which is to be paved with stone; each stone 18 inches square, I demand how many such stones will pave it?

| | f. | i. | | f. | i. | p. |
|---------------------|------------|----|----------------------------|-----------|----|----|
| Length - - - | 21 | 6 | Ditto - - - - - | 21 | 6 | 0 |
| Part of the breadth | 8 | 0 | Complement ditto | 9 | 6 | |
| Product by 8 feet | <u>172</u> | 0 | | <u>10</u> | 9 | 0 |
| | | | | 193 | 6 | |
| | | | Product by 9 feet 6 inches | 204 | 3 | 0 |

added

added thus,

square of each stone

An explanation of the foregoing Tables.

THESE Tables, (for shewing the value of any thing, according to the given price of an integer) differ very little in the construction thereof, to those already treated of and explain'd. The number of what you desire to know the value of, being specified on the head of the table, thus; beginning with 2, 3, 4, &c. to 10; from thence, 20, 30, &c. to 300, and the price will always be found in the first column towards the left hand: but here observe, that the said prices are continued no further, than from the beginning of the Table, page 106, to half way down the opposite page 107, notwithstanding they do particularly refer to the whole succeeding columns of the table throughout, so that the

number required being found on the head of the said table, and the price in the left hand column, the common meeting of the said numbers give you the value thereof, both in pounds, shillings, pence, and farthings, in their several respective columns; only it may be necessary to observe, that when your exact number cannot be found at once on the head of the table, you must make up the deficiency, with adding two tables together; otherwise, by collecting such table as is equal to half your required number, and double the value thereof; examples of which, you have here following, in compound Multiplication, which will (or at least should) exactly prove each other.

Multiplication of compound Quantities.

 \text{£. } 5 \quad 0 \quad 0 \quad \text{facit.}
 \end{array}$$

Explanation of the Work.

First, say 8 times 6 is 48 pence; set down 0, and carry 4, the shillings therein, saying, 8 times 12 is 96, and 4 carried, is 100 shillings, which is 5 pounds; therefore, set down 0 in the place of shillings, and 5 pounds in the place towards the left hand, which is the answer as required.

EXAMPLE II.

What is the value of 9 squares of Carpenters work, at 1 l. 5 s. 6 d. per square?

$$\begin{array}{r}
 \text{£.} \quad \text{s.} \quad \text{d.} \\
 1 \quad 5 \quad 6 \\
 9 \\
 \hline
 \text{£.} \quad 11 \quad 9 \quad 6 \text{ facit.}
 \end{array}$$

Here I say, 9 times 6 is 54 pence, which is 4 shillings and 6 pence; set down 6, and carry 4, saying, 9 times 5 is 45, and 4 carried, is 49 shillings, which is 2 pounds 9 shillings; set down 9 shillings, and carry 2 pounds, saying, 9 times 1 is 9, and 2 I carry, is 11 pounds, and the product is 11 l. 9 s. 6 d. the value required.

EXAMPLE III.

What cost 48 foot of timber, at 1 s. 4 d. $\frac{1}{2}$ per foot?

$$\begin{array}{r}
 \text{£.} \quad \text{s.} \quad \text{d.} \quad \frac{1}{2} \\
 0 \quad 1 \quad 4 \quad \frac{1}{2} \\
 6 \\
 \hline
 0 \quad 8 \quad 3 \quad 0 \\
 8 \\
 \hline
 \text{facit } \text{£.} \quad 3 \quad 6 \quad 0 \quad 0
 \end{array}$$

N. B. The factors, or multipliers, are 6 and 8 (which being multiplied together, make 48, the quantity); therefore, multiplying first by 6, and then by 8, gives the answer.

Q

In

In answering all questions of the beforementioned kind, take any two numbers, which, when multiplied together, will produce the quantity or number given, as in the last example, where 48 is given, the factors for which is 6 and 8, which, as aforesaid, make (multiplied together) 48; therefore these factors, when found, being one of them multiplied by the given price, and the other, by that product, the last product will be the answer, as in the last example. In the first place, I multiply the price by 6, which gives me the price of 6 feet; then I multiply the price of 6 feet by 8, and it gives me the price of 48 feet, as required, and so of all the rest.

E X A M P L E IV.

If 1 yard of any sort of work, or goods, &c. cost 2 s. 9 d. what is the value of 100 yards?

| | | | | |
|---------------|----|----|----|--------|
| | £. | s. | d. | |
| | 0 | 2 | 9 | |
| | | | 10 | |
| for 10 yards | 1 | 7 | 6 | |
| | | | 10 | |
| for 100 yards | 13 | 15 | 0 | facit. |

Note, The factors will be 10 and 10, which being multiplied together, make 100.

E X A M P L E V.

What will the charge of a painted room come to, which measures 144 yards, at 7 d. $\frac{1}{2}$ per yard?

£.

$$\begin{array}{r} \text{£. s. d.} \\ 0 \quad 0 \quad 7 \quad \frac{1}{2} \\ \hline 12 \end{array}$$

$$\begin{array}{r} 0 \quad 7 \quad 6 \quad 0 \\ \hline 12 \end{array} \quad \text{the price of 12 yards}$$

$$\begin{array}{r} 4 \quad 10 \quad 0 \quad 0 \\ \hline \end{array} \quad \text{the price of 144 yards.}$$

First, I multiply the price of 1 yard by 12, which gives the price of 12; then I multiply that product by 12 again, which gives the price of 144 yards as required.

EXAMPLE VI.

What comes 72 squares of tiling to, at 1l. 7s. 6d. per square?

$$\begin{array}{r} \text{£. s. d.} \\ 1 \quad 7 \quad 6 \\ \hline 9 \end{array}$$

$$\begin{array}{r} 12 \quad 7 \quad 6 \\ \hline 8 \end{array} \quad \text{the price of 9}$$

$$\text{facit } \begin{array}{r} \text{£.} \\ 99 \quad 0 \quad 0 \end{array} \quad \text{the price of 72}$$

Here I multiply the price of 1 square by 9, and the product is the price for 9; then I multiply that product by 8, and the product thereof is the price for 72 (for 9 times 8 make 72).

EXAMPLE VII.

What is the charge of 135 yards of paving, at 2s. 6d. $\frac{1}{2}$ per yard.

Q 2

£.

116 *The GENTLEMAN and TRADESMAN'S*

£. s. d.
0 2 6 $\frac{1}{2}$

12

1 10 6 0 the price of 12 yards
11

16 15 6 0 the price of 132 yards
0 7 7 $\frac{1}{2}$ the price of 3 yards

£. 17 3 1 $\frac{1}{2}$ the price of 135 yards.

E X A M P L E VIII.

A Slater hath cover'd a roof, which measures 12 squares, at 1l. 10s. 6d. $\frac{1}{2}$ per square, I demand the charge thereof?

£. s. d.
1 10 6 $\frac{1}{2}$

4

6 2 2 0 the price of 4 squares
3

facit £. 18 6 6 0 the price of 12 ditto

Or thus, by 12, at one operation

£. s. d.
1 10 6 $\frac{1}{2}$

12

£. 18 6 6 answer as above.

Exam-

EXAMPLE IX.

A Glazier hath glaz'd work, the dimensions whereof, when squar'd and cast up, amount to 300 feet, at 1 s. 6 d. $\frac{1}{4}$ per foot, I demand the charge thereof?

| £. | s. | d. | $\frac{1}{4}$ |
|-------|----|----|---------------|
| 0 | 1 | 6 | $\frac{1}{4}$ |
| <hr/> | | | |
| 0 | 15 | 5 | 0 |
| <hr/> | | | |
| 7 | 14 | 2 | 0 |
| <hr/> | | | |
| 23 | 2 | 6 | 0 |
| <hr/> | | | |

facit £. 23 2 6 0 the price of 300, as req.

EXAMPLE X.

Of MERCHANDIZE.

If 1 yard of velvet cost 1 l. 4 s. 6 d. $\frac{1}{2}$, what will 70 yards and $\frac{1}{2}$ cost?

| l. | s. | d. | $\frac{1}{2}$ |
|-------|----|---------------|---------------|
| 1 | 4 | 6 | $\frac{1}{2}$ |
| <hr/> | | | |
| 12 | 5 | 5 | 0 |
| <hr/> | | | |
| 85 | 17 | 11 | 0 |
| <hr/> | | | |
| 12 | 3 | $\frac{1}{4}$ | $\frac{1}{2}$ |
| <hr/> | | | |

£. 86 10 2 $\frac{1}{4}$ answer for 70 $\frac{1}{2}$ yards.

EXAM-

E X A M P L E XI.

What cost 87 pounds of tea, at 10s. 6d. per lb?

| £. | s. | d. | |

| <hr/> | | | |
| 42 | 0 | 0 | ditto - - - 80lb. |
| 3 | 13 | 6 | ditto - - - 7lb. |
| <hr/> | | | |
| facit £. | 45 | 13 6 | the value of 87 lb. |
| <hr/> | | | |

E X A M P L E XII.

If 1 gallon of rum cost 8 s. what will 1000 cost at that rate?

| £. | s. | d. | |
|-------|-----|-----|---------------|
| 0 | 8 | 0 | |
| | | 10 | |
| <hr/> | | | |
| 4 | 0 | 0 | price of 10 |
| | | 10 | |
| <hr/> | | | |
| 40 | 0 | 0 | ditto of 100 |
| | | 10 | |
| <hr/> | | | |
| £. | 400 | 0 0 | ditto of 1000 |
| <hr/> | | | |

If a hogshead of tobacco cost 3l. 8s. 4d. $\frac{1}{2}$, what will 700 cost at that rate?

£.

| £. | s. | d. | |
|-----------------|------|----|------------------|
| 3 | 8 | 4 | $\frac{1}{2}$ |
| <hr/> | | | |
| 34 | 3 | 9 | 0 price of 10 |
| <hr/> | | | |
| 34 ¹ | 17 | 6 | 0 ditto of 100 |
| <hr/> | | | |
| £. | 2393 | 2 | 6 0 ditto of 700 |

This method of finding the value of any number of feet, yards, squares, pounds, gallons, hogheads, or any other thing you desire, is of great use, as the work is here perform'd in a short and easy manner, and very often exceeds the method of practice, and will undoubtedly be of excellent use to all those who buy and sell by retail, and to every person almost, of whatsoever trade or business.

To exercise the last tables by those examples.

EXAMPLE I.

Being to find the value of 8 rod of brick-work, at 12 s. 6 d. per rod.

Look on the head of the table for 8, then seek your price on the left hand column, viz. 12 s. 6 d. and you will find thus, for 12 s. (in the column that hath 8 on the head thereof) 4 l. 16 s. 0 d. and in the same column, a little above, opposite 6 d. (the complement of the price) 4 s. which, added to the above, make 5 l. 0 s. 0 d. the price thereof;

thus,

| | | £. | s. | d. | |
|-----|-------|----|------------|----|----------------|
| For | 12 s. | | per rod | 4 | 16 0 |
| For | | | 6 d. ditto | 0 | 4 0 |
| | | | | | <hr/> |
| For | 12 s. | | 6 d. ditto | 5 | 0 0 the proof. |
| | | | | | <hr/> |

This example may be sufficient, where the exact number is always found on the head of the table; but, as I said before, as it will not always hold out so, the following example will be necessary, in order to instruct the learner how to proceed, when he cannot find such number as he would know the value of.

E X A M P L E XII.

Where the value of 1000 gallons of rum, at 8s. per gallon, is required; this number not being to be found, I take the table 200, which having found 8s. in the price column, I find, opposite thereto, in the common meeting with 200 column, 80l. 0s. 0d. therefore this only being the value for 200, I want 5 times this number, for 5 times 200 make 1000; therefore proceed thus, if you can multiply.

| | | | | |
|-----|----------|----|----------|--------------------|
| for | 200 | £. | 80 | |
| | <u>5</u> | | <u>5</u> | |
| for | 1000 | £. | 400 | the value thereof. |

Or

Or thus, by Addition,

| | | | |
|-------------|------------------------|-------|----------------------|
| 200 | at 8 s. per gallon, is | £. | 80 |
| 200 | ditto | ditto | 80 |
| 200 | ditto | ditto | 80 |
| 200 | ditto | ditto | 80 |
| 200 | ditto | ditto | 80 |
| <u>1000</u> | ditto | ditto | <u>£. 400</u> proof. |

These examples will be sufficient to instruct the learner how to find the value of any thing almost whatsoever required, either by the tables, or multiplication; therefore, shall leave the rest of these examples for practice.

* * *Note*, That whereas, the great utility of this Book may perhaps induce several persons to purchase it, who are not so perfectly acquainted with the use of figures as they could wish, or at least able to divide the products of the several dimensions by 9 (in order to obtain the square yards, or 100 for the squares), therefore have, at the latter end of hereof, inserted two Tables, which shew, by inspection, the number of square yards contain'd, from 18 to 1737, with instructions to any higher number required; also, how to find the squares of 10 feet, in any number whatsoever.

* * The reader is here to observe, that I have calculated the former part of these tables so far, to increase only a quarter of an inch at each step in the breadth, which will be found very convenient for measuring of glafs, and the like, being more particular in taking their dimensions, than what several other branches commonly require.

CHAP. II.

TABLES continued.

An Explanation of the last Table.

This Table consisteth of 11 columns; in the first whereof, that towards the left hand, having the word inches at the top, or head thereof, beginning with a —, representing half an inch; then the figure 1, which is one inch; then again —, signifying half an inch more, and so downwards by half inches to 18 inches, shewing the side of the square of any squared timber, or stone; and in the other 10 columns, at the heads of them, 1, 2, 3, 4, &c. to 10, they represent the length of any timber, tree, stone, &c. in feet; so that if you find the length of the side of the square in inches and half inches in the first column, and the length of such timber or stone in feet (at the head of the table) in the square, (or meeting of these two numbers) you have the content of feet contained in that stone or timber, observing, that the table begins at half an inch; and so continues by half inches to 36 inches, the side of the square; and from 1 foot to 10 feet in length, by examples.

E X A M P L E I.

If the side of the square, at the end of any timber or stone, be 15 inches, and the length thereof 5 feet, how many feet are there in the stone, or timber log?

Find 15 inches in the first column of the table; and right against it, under 5 feet, the length, you shall find 7, 81, which is 7 feet and 81 hundred

hundred parts of a foot; for 25 parts is a quarter of a foot; 50 parts, half a foot, and 75 parts three quarters of a foot; so that in this stone, or timber, there are 7 feet, and above three quarters.

Thus, by feet and inches,

| | f. | i. | p. |

| Feet | 7 | 9 | 9 anfw. |
| | <hr/> | | |

EXAMPLE II.

If the square of a timber tree be 17 inches and an half, and the length thereof be 9 feet, how many feet are contained therein?

Look for 17 inches and an half in the first column; against which, in the column of 9 feet, you have 9, 14, that is, 19 feet, and 14 hundred parts of a foot, which is about half a quarter of a foot.

See the work in the following page.

E X A M P L E III.

If a piece of timber, or stone, be 30 inches square, and 10 feet long, how many feet are there in that piece?

Find 30 inches, the breadth, in the first column; and against it, under 10 feet, the length, you will find 62 feet 50 parts; and so many feet doth the piece contain.

| <hr/> | | |

EXAMPLE IV.

If the square of a timber tree be 27 inches, and the length thereof 18 feet, how many solid feet are there in that tree?

Because the table goeth but to 10 feet in length, and this tree is 18 feet long; therefore, as you did before in Board Measure, take half the length thereof, which is 9 feet; then finding 27 inches, the square, in the first column, and right against it, under 9 feet, you will find 45 feet 57 parts; and so many feet would the tree have contained, if it had been but 9 feet long; but being 18 feet long, it must contain as much more, that is, 91 feet and 14 parts (which is half a quarter of a foot); and thus, if the tree be very long, as 30, 40, 50 feet, &c. you may take so many times 10 feet, as there are tenths in its length, and the odd feet by themselves, and add all together; so a timber tree being 31 inches square, and 47 feet long, will be found by this table to contain 313 feet 62 parts, that is, half a quarter above half a foot.

Fourth Example by Feet and Inches.

| | <hr/> | | |

N. B. In the examples beforegoing, we have supposed the tree or stone we measured, to carry the same square from end to end, throughout the piece; but we see, that in all or most trees, (especially if they are very long) there is a great difference between the squares of each end of the tree; wherefore, Workmen and other Measurers do, for the most part, make choice of some convenient place in the middle of the tree, and take the square thereof for the true (except by chance); therefore, in such timber trees, measure the squares at both ends, and add the sides of those two squares together, and half that length will be the true square which the tree will carry throughout: thus, If a timber tree have the side of the square at the great end, 32 inches, and at the lesser end, 23 inches, these two added together will make 55 inches, the half whereof is 27 inches and an half, and that is the true side of the square, with which, and the length by the table, you may find the content, as is before taught.

A TABLE, shewing, at one view, the number of Squares contain'd in any number of Feet, from 120 to 890, by inspection, which, with the help of Addition only, to any higher number required.

| No. of feet | squares and feet therein sq. f. | No. of feet | squares and feet therein sq. f. | No. of feet | squares and feet therein sq. f. |
|----------------|--|----------------|--|----------------|--|
| 120 | 1 20 | 380 | 3 80 | 640 | 6 40 |
| 130 | 1 30 | 390 | 3 90 | 650 | 6 50 |

| 240 | 2 40 | 500 | 5 | 760 | 7 60 |
| 250 | 2 50 | 510 | 5 10 | 770 | 7 70 |
| 260 | 2 60 | 520 | 5 20 | 780 | 7 80 |
| 270 | 2 70 | 530 | 5 30 | 790 | 7 90 |
| 280 | 2 80 | 540 | 5 40 | 800 | 8 |
| 290 | 2 90 | 550 | 5 50 | 810 | 8 10 |
| 300 | 3 | 560 | 5 60 | 820 | 8 20 |
| 310 | 3 10 | 570 | 5 70 | 830 | 8 30 |
| 320 | 3 20 | 580 | 5 80 | 840 | 8 40 |
| 330 | 3 30 | 590 | 5 90 | 850 | 8 50 |
| 340 | 3 40 | 600 | 6 | 860 | 8 60 |
| 350 | 3 50 | 610 | 6 10 | 870 | 8 70 |
| 360 | 3 60 | 620 | 6 20 | 880 | 8 80 |
| 370 | 3 70 | 630 | 6 30 | 890 | 8 90 |

The use of the above Table is this: Suppose your content (after the squaring any dimensions) should be 620 feet, and you were desirous to know how many squares were therein contain'd, look for your number of feet in the table, num-

bers, and opposite which, you will find 6 square^s and 20 feet remaining, which is equal to 1-5th part of one square more: this being so easy, shall think it unnecessary to give any other example; and notwithstanding this table is continued no farther than to 890 feet, it may be sufficient to enable any person whatsoever to find the squares in any higher numbers, if but duly observing the direction given, (together with the examples at large) for finding the same at the beginning of this book, which, for memory sake, shall give an example or two in this place, and so conclude: thus, Suppose then, 3760 feet were given, to find the number of squares therein;—cut the two last figures, next the right hand, off, with a dash of your pen or pencil, thus, 37|60, and the figures 37, next the left hand, are the squares therein; and the 60, next the right hand, are the remaining feet; and this is all you have to remember, in any number whatsoever required: thus again, squares, 1234|56 feet.

A TABLE, shewing, at one view, the number of square yards contain'd in any intermediate numbers of feet, from 18 to 1737.

| No. of feet | sq. yds. | No. of feet | sq yds. | No. of feet | sq yd | No. of feet | sq.yd |
|-------------|----------|-------------|---------|-------------|-------|-------------|-------|
| 18 | 2 | 243 | 27 | 468 | 52 | 693 | 77 |
| 27 | 3 | 252 | 28 | 477 | 53 | 702 | 78 |

| 1116 | 124 | 1323 | 147 | 1530 | 170 | 1737 | 193 |

The Use and Explanation of the last Table.

E X A M P L E.

Suppose the square of any dimension in feet be 738, how many yards square are in that number?

Look in the Table, under these words (number of Feet), for the nearest number

C c 2

thereto

thereto (which here, h, you find the exact number); and in the next column of figures, under these words at top (number of square yards), opposite your said number 738, you will find 82, the square yards therein contain'd.

The Proof by Division.

$$\begin{array}{r}
 \text{feet in a square yard } 9)738(82 \text{ square yards} \\
 \underline{72} \\
 18 \\
 \underline{18} \\
 \ddots \\
 \smile
 \end{array}$$

By this example, you may find any number of square yards, not exceeding 1737, the extent of this table; and for any higher numbers, you may, by practice, easily find, by doubling any two numbers in the table, so as to make your number requir'd, and add the products together, which will give you the true number of square yards therein: one example may be sufficient, which suppose 3460 feet should be requir'd, wherein to find the square yards?

First then, I seek in the table as above directed, for 1000, or the nearest number thereto, which here, k, I find 1008; opposite which, I find 112 square yards; and whereas, I find my number will admit of 3 times as much, being 3000 and upwards, I triple 1008, which make 3024 feet.

Thus;

Thus, by Addition; then triple the square yards

$$\begin{array}{r} 1008 \\ 1008 \\ 1008 \\ \hline \end{array} \quad \begin{array}{r} 112 \\ 112 \\ 112 \\ \hline \end{array}$$

feet 3024 336 square yards therein

and you will find 336 to be contain'd in 3024 feet; then, by Subtraction, I find the feet remaining thus:

$$\begin{array}{r} 3460 \text{ the given number, feet} \\ 3024 \text{ feet collected from the table} \\ \hline \end{array}$$

Difference . 436 or feet wanting

then seeking this number in the table, I find the nearest to be 432; the square yards contain'd in which, I find 48, which being added to

$$\begin{array}{r} 336 \\ 48 \\ \hline \end{array}$$

make 384 square yards, and 4 feet over

and so many square yards are contained in 3460 feet.

See the proof by Division.

This example may perhaps seem difficult, but practice will render it very easy.

T H E

Gentleman *and* Tradesman's

COMPLEAT ASSISTANT, &c.

P A R T III.

C H A P. I.

Of Measuring Superficies, &c.

IT is very necessary for him that intends to be an Artist in Measuring, (supposing of what kind soever) to begin with ARITHMETIC, as it is the ground-work and foundation of all Arts and Sciences, mathematical; and at least not to be ignorant of the five first and principal Rules thereof, viz. Numeration, Addition, Subtraction, Multiplication, and Division, which I hope every person that applies himself to the study of this Art, to be skilled in; or, if not, I would refer him to BOOKS or MASTERS, thereby to be properly instructed.

There

There is also a Sixth Rule as necessary (if not more) to be understood by the learner, which is, the EXTRACTION of the SQUARE ROOT; without which, no person can well attain to a competent knowledge in this ART; I shall not, therefore, think it unworthy my pains, to shew how it may be performed both with ease and brevity.

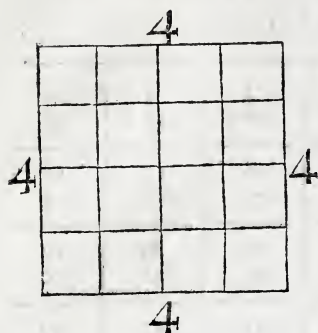

Explanation of the SQUARE ROOT.

To find the Square Root, is to find out of any number propounded, a lesser number; which said number being multiplied in itself, may produce the number propounded.

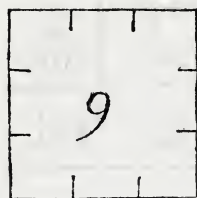

As for Example:

Suppose 81 be a number given to be extracted, I say 9 is the root of it; because 9, multiplied in itself, viz. 9 times 9 produces 81, the given number; now it may be necessary to shew, why another figure, as 8 or 10, should not be the square root of 81, as well as 9; which suppose, for example, 8 were tried, which could not be the root, because 8 times 8 is but 64, which is too little; and 10 times 10 is 100, which is too much; therefore, I say, 9 must needs be the root, because multiplied in itself, makes neither more nor less, but just the number propounded, or given, to be extracted, viz. 81.

Again,

contain 4 little squares, which is call'd the Square Root.

Or suppose a plain square figure be given you, as in the margin, and it be required of you to divide it into 9 small squares, your business is to know, into how many parts to divide any one of the side lines, which here must be into 3, and that is the Root required: but how to do this with ease and expedition, in any number given to be so extracted, is what I shall, in the next place, explain to the meanest capacity.

The roots of all square numbers under 144, you have in your Multiplication table; but for the greater convenience of all young Arithmeticians, and others, not acquainted with the general Rule or Method of extracting the Square Root, I have calculated a Table, in which the Roots of all given square numbers, regularly arising from 1 to 10000, are already extracted, and also prefixed to each respective number thereunto belonging, as here follows:

D d

Roots

The T A B L E.

| | | | | | | |

| Squares | 9801 | 10000 | | | | | |

Explanation of the above Table.

Suppose the number given to find the square root of, be 1444; seek for the number in the table, in the line of figures, facing, or opposite the word squares (looking cross-ways the book); and when you have found the said number (or nearest thereto not exceeding), you will find the root for such number, in the very next square, exactly above it, as here, a, you find the exact number 1444 given, and its root above it, 38, in the line of roots. This example may be sufficient to instruct any person how to find the root, in all such number of squares as fall within compass of this table; but whereas it will happen, that sometimes the number given to find the square root of, cannot be exactly found in the table, it will be necessary to give the reader an example thereof; which suppose it were required to extract the square root of 1320, which said number is not to be found exactly in the table, therefore you must seek for the nearest, not exceeding, which b, here, you find to be 1296, the root of which is 36; but whereas a small value is here lost in the remainder, it will be

D d 2

necessary

necessary to observe the following method to obtain it, thus, find the deficiency by Subtraction, thus:

the given number is . 1320
 the nearest number is 1296 as per table

the number deficient . . 24 or difference

now to find the value of this difference remaining, observe the following rule: Subtract the table, number 1296, from the next succeeding number, which is 1369, and the difference is equal to a unit, or 1, in the root, thus,

$$\begin{array}{r} 1369 \\ 1296 \\ \hline \end{array}$$

difference . . 73 equal to a unit, or 1;

therefore, the deficient number, 24, as above, being compared therewith, or divided thus,

$$\begin{array}{r} 24 \overline{)73} (3 \text{ equal } 1-3d. \\ \underline{72} \\ 1 \end{array}$$

gives 1-3d. of a unit more, to be added to the root, so that 36 1-3d. is the square root of 1320; which suppose were feet, the square root would be 36 feet, 4 inches, equal to 1-3d. of an integer, which here is 1 foot.

This last example is worthy of due observation, as all those unequal numbers, which cannot be exactly obtained by the table, will admit of some remainders, which by this method, the value thereof may be obtained to the nearest truth;

truth; and though perhaps it may to those (rather deficient in the use of figures) seem difficult, yet a little practice, with due observation, will render it very easy.

As to those already acquainted with the method of extracting the Square Root arithmetically, it is done with pleasure; but to attempt explaining it in this place, to those deficient, it would only be rather confounding them, than otherwise, therefore shall refer them to the use of the table, which I have calculated chiefly for their convenience; and by which (with the examples just mentioned) they may be enabled to find the root of almost any number required, in the common way of business. See the proof of the last question, in the square root,

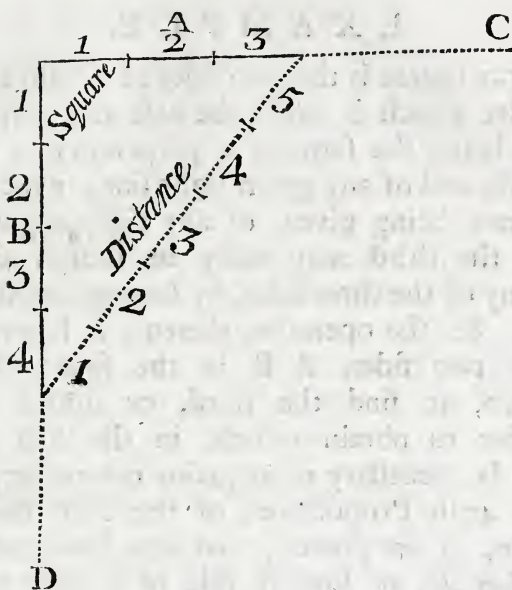

E X A M P L E.

Let it be required to extract the square root of 1320 feet, the value of the root being also demanded?

$$\begin{array}{r}
 \text{f.} \\
 1320 \overline{) 36,34} \\
 \underline{9 \quad 12} \\
 66 \overline{) 420} \quad 4,08 \text{ inches} \\
 \underline{396} \\

 \underline{2169} \quad \text{answer } 36,4 \\
 7264 \overline{) 3100} \\
 \underline{3056} \\
 44
 \end{array}$$

Explanation of the Artificer's Square, and how to make it with the greatest ease and exactness, to any size required.

After you have fitted yourself with a piece of good, sound, well-seasoned wainscot, &c. fit for your use, cut the same, to the length you intend to have your square; then divide one side into three equal parts, and the other into four, with the same extent, (the two pieces first being fitted for joining together, at pleasure) fix them, according to your eye, as near a square as you can; then, with the same extent of your compasses you divided them with into equal parts, measure the distance between the greatest extremity of their legs, viz. from 3 to 4, in the figure hereof, making it exactly five of those parts; which being done, be careful then to join your square together, without the least alteration or moving, you may depend your square is perfectly true. See the figure thereof, represented by the two lines A and B.

And here you are to understand, that you may make your Square what size you please, only observing this rule; that after dividing the two sides into equal parts, as above, the distance from the 3d division on one side, as on A, and the 4th on the other, as on B, measure just 5 of the same divisions; then you may afterwards extend the sides of your square, to what length you please, as in the above figure is described, by the pricked lines from A and B, extending to C and D.

How to prove the above Square by the Square Root; with several other necessary examples, for the learner's more clear comprehension of that most useful part of Geometry.

EXAM-

E X A M P L E.

A true square is the two sides of a right angled triangle, which is call'd the base and perpendicular, being the same as a perpendicular rais'd upon the end of any given right line; which said two lines, being given, of any right angled triangle, the third may easily be found, and so may any of the three sides, by having two thereof given. See the operation thereof, at large.

The two sides, A B, in the square above, is given, to find the third, or dotted line; in order to obtain which, in the first place it will be necessary to acquaint the reader, that in the 47th Proposition, of the First Book of EUCLID, it is proved, that the square of the hypotenuse, or longest side of a right angled triangle, is equal to the sum of the squares of the base and perpendicular, or the other two sides; therefore, the perpendicular, or side of the square A, here given, I shall say is 3 feet, and the base B, the other side, being 4 feet, I demand the length of the other side?

First, according to the rule given, square the sides, thus,

| | | | | | |
|---------|-------|---|----|----|---------------------|
| 3 | times | 3 | is | 9 | sq. of the perpend. |
| then, 4 | times | 4 | is | 16 | square of the base |

which added together, is 25

therefore the square root of 25, is 5, as you will find in the table marked e, the length of the other side required (being the dotted line, or distance between the legs of the square).

Again,

Again, suppose this side, and the other side, B, were given to find A, thus; the hypotenuse, or longest side here last found, is 5 feet, and the perpendicular B, 4 feet, I demand the side A, thus, hypotenuse 5, squar'd, is 25
perpendic. 4, squar'd, is 16

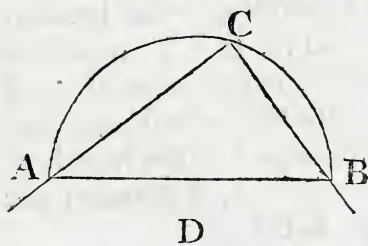

subtracted, is 9 the difference;
the square root of which, as per table, is 3 c,
the side required.

Lastly, suppose the hypotenuse, or longest side, and the perpendicular side A, to be given to find the base, or side B, thus,

| | |
|--|----|
| The hypotenuse is 5, the square whereof is | 25 |
| The perpendic. is 3, the square whereof is | 9 |

Which being subtracted, the difference is 16
the square root of which, as per table at d, is 4, the length requir'd.

By another method.

First, draw a right line, as A B, which divide into two equal parts, in the point D; and upon D, with the distance B D, describe the semi-circle A C B; secondly, in any point of the circumference thereof, make a point, as at C; from which point, two right lines being drawn to A and B, they shall constitute a square, or right-angle, at the point C; and so two pieces of wood, being framed together, shall be a true square.

Note, So much, then, I presume, may be sufficient to qualify the learner, to find the three

sides severally belonging to any right angled triangles, being the most curious proposition relating to Geometry; and what too few persons, amongst the Mechanics, are acquainted with; notwithstanding, being sensible of its great utility in the several branches of trade.

It may be necessary, in the next place, to acquaint the reader, that in respect to the above doctrine of a right angled triangle, that when once he is clear in the comprehension thereof, he will be qualified to find the length of the hip-rafter belonging the off-set of any building whatsoever, whether the roof be of square, bevil, or flat pitch, as I shall hereafter explain, by fig. 1. plate 1.

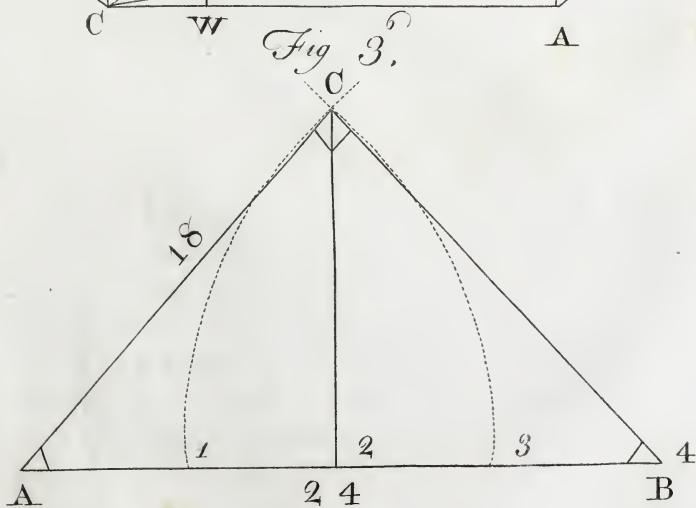

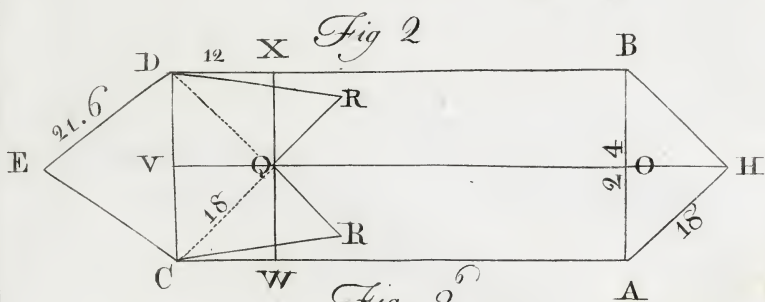

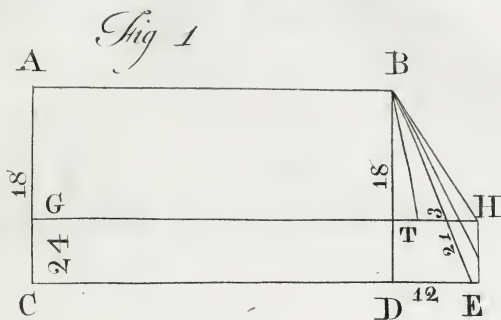

E X A M P L E.

Let C E, represent the length; and E H, or C G, the breadth of a building, the breadth thereof being 24 feet; and let D B T, represent the principal rafters, whose length thereof is 18 feet, or 3-4ths of the width of the building, (being true pitch'd) and also equal to the length of the side of the gable end, C A, I demand the length of the corner hip, E B?

In order to perform which, observe this general rule:

That the square of the principal rafter, added to the square of the distance, from the foot thereof, to the corner of the building (equal to half the width of the house), the square root of that product will be equal to the length of the hip-rafter. See the following example.

E X A M-

E X A M P L E.

Half the width of the building, D E, is 12 feet,
the square thereof is 144.

$$\begin{array}{r} \text{thus, } 12 \\ \text{by } 12 \\ \hline 144 \end{array}$$

Then the length of the principal rafter, D B, is
18, the square thereof is 324.

$$\begin{array}{r} \text{thus, } 18 \\ \text{by } 18 \\ \hline 324 \end{array}$$

to which add the above

| | |
|-------|--------------------------------|
| 324 | square of the principal rafter |
| 144 | square of half the width |
| <hr/> | |

the sum extracted 468,00 (21,6 length of the hip, as req.

$$\begin{array}{r} 4 \\ \hline 41 \overline{) 68} \\ 41 \\ \hline 2700 \\ 2556 \\ \hline 144 \end{array}$$

Note, You may find the root of 468, in the square root table aforegoing, (or the nearest number thereto) which is 441, the root of which is 21; the length of the hip, as above; as for the 6 tenths over and above (the value of which, is somewhat more than 7 inches), you may find by the explanation of the table, as directed.

To find the length of the hip, instrumentally.

Example. Fig. 2, Plate 1.

First, from a scale of equal parts, lay down the length and breadth of your intended building, represented in the plate, by the figure *ABCD*, (one end being to be hipped, and the other a gable end) drawing the lines *ABCD*, the length and breadth of the roof; which said breadth *CD* or *AB*, to be 24; then draw the gable end *AHB*, whose sides *AH* and *BH*, are each equal in length to 3-4ths of the width 24, which will be 18 (the building being true pitch'd), then draw the perpendicular line *OH*, the height of the gable end (which line is of general use to level the ridge of all roofs); and if the other end be hipped, as in the design *CDE*, then it serves to find the length and back of the hip, so that it may answer both sides and end of the roof; always observing, that the middle of the breadth of the house is as *OV*; next, draw the line *WX* through the center *Q*, which will make right angles to the line *OV* (both in square and bevil houses), the length of the rafter being equal to *AH* or *BH*, the two sides of the gable end in 18; lastly, draw the line *QO*, which is the length of the ridge; then to find the length of the hip, draw the diagonal lines, *CQ* and *QD* (over which the hip is to hang when in its due place); then take the perpendicular line *OH*, and place it from the point *Q* to the point *RR*, the one perpendicular to the diagonal (or base line) *CQ*, and the

the other to Q D, so is Q R and Q R, the pitch of the hip, equal to the gable end O H; and when erected, will hang perpendicular to the point Q; then take the line C R and R D, placing them from C to E, and from D to C, and it gives the length of the hip C E D; which being applied to your scale of equal parts, will measure 21, and 7-twelfths, equal to 21,6, as in the former example, arithmetically.

Of a Roof. Fig. 3, Plate 1.

This roof is a proper pitch for covering with plain tiles. To find the perpendicular height, divide the breadth of the building into 4 parts, and take 3 of those parts for the length of the rafter, which will intersect in C, the perpendicular height; this is called true (or common) pitch, being the most in use.

In the next place, shall think it not unnecessary to give two or three examples in the Square Root, by way of amusement.

Q U E S T I O N I.

If the content of a circle be 169, what is the side of a square, equal in area, to the given circle?

E X A M P L E.

Look for the above number 169, in the square root table, and the root thereof is the side of a square, equal in area to the given circle, which here, at g, you will find 13; the answer required.

Q U E-

Q U E S T I O N II.

A certain number of men, spent at a reckoning, the sum of 14*l.* 8*s.* and every man paid as many fixpences, as there were men in company; how many were there?

E X A M P L E.

Bring the money into fixpences,

| | | | |
|-------------|-----------|-----------|-------------------------|
| | <i>l.</i> | <i>s.</i> | |
| thus, | 14 | 8 | |
| | 20 | | |
| | <hr/> | | |
| | 288 | | shillings |
| multiply by | 2 | | fixpences is 1 shilling |
| | <hr/> | | |
| | 576 | | number of fixpences |

Seek this number in the table, and the root thereof is the number of men, which here, *f*, you find is 24; the number required.

N. B. That various questions, of the like nature, may be solved with ease and pleasure, which the learner may practice at his convenience.

~~CHAP. II. OF GEOMETRICAL DEFINITIONS.~~

C H A P. II.

Of GEOMETRICAL DEFINITIONS.

A Point is that which hath neither length nor breadth; the least thing which can be imagined, and which cannot be divided, commonly marked as a full stop, in writing, thus, (.)

A line has length, but no breadth nor thickness, and is made by many points joined together in length, of which there are two sorts, viz. streight, and crooked, as AB , fig. 1. plate 2. is a streight line, and BC , fig. 2. two crooked lines.

An angle, is the meeting of two lines in a point, provided the two lines so meeting, do not make one streight line, as the line AB , fig. 3. and the line AC , meeting together in the point A , make the angle BAC .

Of which right lined angles, there are three sorts, viz. right angled, acute, and obtuse; when a line falleth perpendicularly upon another line, it maketh two right angles, as fig. 4.

E X A M P L E.

Let CAB be a right line, DA a perpendicular to it, that is to say, neither leaning towards B or C , but exactly upright; then are both the angles at A , viz. DAB and DAC , right angles, and contain each just 90 degrees, or the fourth part of a circle; but if the line DA had not been perpendicular, but had leaned towards B ; then had DAC been an obtuse, or greater than a right angle, and DAB an acute angle, or lesser than a right angle, as you see hereafter, fig. 5.

All figures contain'd under three sides, are called triangles, as ABC , fig. 6, 7, and 8.

Where note, the triangle A , hath three equal sides, and is called, an equalateral triangle.

The triangle B , hath two sides equal, and the third unequal, and is called, an isosceles triangle.

The triangle C, hath three unequal sides, and is called a Scalenum.

Of Four-Sided Figures, there are these sorts, viz. First, a square, whose sides are all equal, and angles right, as A, fig. 9.

Secondly, A long square, or parallogram, whose opposite sides are equal, and angles right, as B, fig. 10.

Thirdly, a rhombus, whose sides are all equal, but no angle right, as C, fig. 11.

Fourthly, a rhomboides, whose opposite sides only are equal, and no right angles, as D, fig. 12. All other four-sided figures, are called trapezias, as E, fig. 13, &c.

There are also several other figures contain'd under 5, 6, 7, or more sides, which may be called, irregular, excepting such as are made by dividing the circumference of a circle into any number of parts; for then they are regular figures, having all their sides and angles equal, and are called, according to the number of right lines the circle is divided into; or, more properly, according to the number of angles they contain, as a Pentagon, Hexagon, Heptagon, Octagon, &c. which, to explain in English, is no more than a figure of 5, 6, 7, or 8 angles; which angles are all equal one to another, and their sides consequently all of the same length; and thus (though I mention no more than 8) the circumference of the circle may be divided into as many parts as you please; and the regular figures, arising out of such divisions, are called according to the number of parts the circle is divided

divided into; which, for your better understanding, see the following table and figures in the plate.

Of a Circle, as Fig. 15.

A circle, is a figure determined with one endless line, as A, which line is called the circumference of the circle, in the middle whereof is a prick, or point, by which the circle is described, which is called the center; from which point, or center, all streight lines drawn to the circumference E, are equal, or of the same length as AB, AC, AD.

The diameter of a circle, is a line which passeth through the center, cuts the circle into two equal parts, or the longest streight line that can be made in any circle; as BC, the semi-diameter, is the half of the abovementioned line, as AB, AC, AD, either of which is called a semi-diameter.

A chord, is any line shorter than the diameter, which passeth from one part of the circumference to another, as EF, fig. 14.

A semi-circle is the half of a circle, as BDC, or BEC.

A quadrant is the fourth part of a circle, made by two diameters, perpendicularly intersecting each other, as ABD, ADC, ABE, AEC, either of which is a quadrant, or the fourth part of a circle.

A section-segment, or part of a circle, is the piece of the circle cut off by a chord line, and is greater or lesser than a semi-circle, as ECFG.

F f

is

is a segment of the circle E B D C G, and likewise E B D C F, is the greater segment of the same circle.

A superficies, is that which hath both length and breadth, but no thickness, whose bounds are lines; as A is a superficies, or plain, contained in these lines BC, DE, BD, CE, which hath length from B to C, and breadth from B to D, but no thickness; observe the parallelogram, fig. 16. When these bounding-lines are measured, and the content of the superficies cast up, the result is called the area, or superficial content of that figure.

E X A M P L E.

Suppose the said figure to be a superficies, whose length A——C is 12 feet, and breadth

A

| 4 feet; these multiplied together, make 48 feet;
D

therefore, I say, 48 square feet is the area, or superficial content of the said figure.

N. B. If to either the length or breadth of the above, there had been any inches, then it would (and always will) require Cross-Multiplication to find the content.

When two lines are in every part equally distant from each other, they are called parallel lines, as the lines AC and BD, under fig. 16, which, tho' produced to ever so great a length, would come no nearer to each other, much less meet.

A diagonal line, is a line running through a square figure, dividing it into two triangles; beginning at one angle of the square, and proceeding to the opposite angle.

CHAP. III.

Geometrical Problems.

Problem 1. Fig. 17.

How to raise a perpendicular upon the end of a given line.

A B, is the line here given; and at B, it is required to erect a perpendicular B C; open your compasses to an ordinary extent, and setting one foot in the point B, let the other fall at adventure, no matter where, in reason, as at the point \odot ; then, without altering the extent of the compasses, set one foot in the point \odot , and with the other, cross the line A B, as at D; also, on the other side, describe the arch E; then laying your ruler to D and \odot , draw the dotted line D \odot F; lastly, from the point B, you began at, through the intersection at G, draw the line B, G C, which is perpendicular to A B.

N. B. There are several other ways to perform the above; but, in my opinion, this is the most easy for practice.

Problem 2. Fig. 18.

Let AB , be the given line; C , the point through which the parallel line must pass: set one foot of your compasses in C , and closing them, so that the other will just touch the line AB , describe the arch aa ; with the same extent, in any part of the given line, set one foot, and describe another arch, as at D ; then, through the assign'd point, and the outmost convex of the last arch, draw the required line CD , which is parallel to AB , and passeth through the point C , as required.

Problem 3. Fig. 19.

A right line, as AB , given to make therewith a true geometrical square.

E X A M P L E.

Upon one end thereof, as at B , erect the perpendicular BC , of the same length with AB , and with that distance, fixing one foot of the compasses in C and A , draw two small arches, crossing each other in the point D ; join AD and CD with right angles, and they will constitute the square required.

Problem 4. Fig. 30.

Any right line being given to form or make a rhombus, or oblique-angled parallelogram.

E X A M P L E.

This figure is no other than two equilateral triangles, joined base to base, as the pricked lines

cd plainly shews, and might be made or described after the same manner (viz. by Prob. 8); or thus, make the given line, radius, or 90, thus \wedge , and on each end thereof, describe an arch; which being continued, till it meet with the other arch in the points a and b , shall give you the length of the rhombus sought; and if you divide the two arches in the middle, which is done with the same radius, it will help you to the breadth thereof, viz. cd ; and thus have we found four points, from which, drawing right-lines, they will compleat the figure required.

Problem 5. Fig. 31.

To describe a circle, that shall pass through any three points, not laying in a right line, as ABC .

E X A M P L E.

Join the points BA and BC with right lines; then bisect or divide those lines in the middle, and continue to draw the bisecting line till they meet each other; so shall the point of intersection D , give you the center of the circle required.

Hence 'tis easy to find the center of any given circle, if three points be taken any where in the circumference; or by having a segment, or part of any circle, to compleat or describe the whole.

Problem 6. Fig. 32.

How to divide a circle into any number of equal parts, not exceeding twelve; or otherwise,
how

how to make the figures, called, Pentagon, Hexagon, Heptagon, Octagon, Eneagon, Decagon, Endecagon, and Dodecagon; which, for better understanding to the learner, shall explain the nature thereof, as follows, viz.

| | | | | | | |
|------------------------------|---|----|---|---|---|-----------|
| If the figure consists of | } | 5 | { | equal sides and angles, it is called a re- gular | } | Pentagon |
| | | 6 | | | | Hexagon |
| | | 7 | | | | Heptagon |
| | | 8 | | | | Octagon |
| | | 9 | | | | Eneagon |
| | | 10 | | | | Decagon |
| | | 11 | | | | Endecagon |
| | | 12 | | | | Dodecagon |

Problem 7. Fig. 32.

To make a Pentagon, or five-sided figure.

Draw first an obscure circle, as A B C M; then draw a diameter from A to B; make another diameter perpendicular to the first, as C M; then, taking with your compasses the length of the semi-diameter, set one point in A, and make the marks E F, drawing a line between them, as you did to make the triangle; next, set one point of your compasses in the intersection at g, and extend the other to C, draw the arch C H, the nearest distance between C and H, viz. the line C I H, is the side of a pentagon, and the greatest that can be made within that circle, which, with the same extent of your compasses, you may mark out round the circle, and drawing lines, the figure will be finished.

Note, The semi-diameter of any circle, is the side of the greatest hexagon that can be made within a circle.

Problem 8. Fig. 24.

How to make a Hexagon.

Draw an obscure circle, as in the last figure e e; and then, without altering the extent of the compasses, mark out the hexagon required, round the circle; for the semi-diameter of any circle, is the side of the greatest hexagon that can be made within a circle. This is the way Coopers use, to make heads for their casks.

Problem 9. Fig. 33.

To make an Eneagon.

First, make a circle, and a triangle in it, as you were taught at the beginning of this problem; then, divide one third part of the circle into three equal parts; as for example: A B, 1, 2, 3; lastly, draw the lines A, 1, 2, 3; B the same, and C also, for each of which is the side of the eneagon required.

Problem 10.

To make a Decagon, or ten-sided Figure, you must work altogether, as you did in making a pentagon as before; where half the distance from the center K, to the point at H, is the side of a decagon.

Problem 11. Fig. 34.

How to make an Ellipsis, or Oval, several ways.

E X A M P L E.

Make three circles, whose diameters may be in a streight line, as A B; cross that line with

another perpendicular to it, at the center of the middle circle, as $c d$, draw the lines $c e$, $c h$, $d g$, $d f$; set one foot of the compasses in D , and extend the other to g , describing the part of the oval, or ellipsis, $g f$, with the same extent, setting one foot in c , describe the other part $h e$; the two ends are made by parts of the two outermost small circles, as you see $f e$, $g h$.

Problem 12. Fig. 35.

This Ellipsis is to be made, having length and breadth both given, let $A B$ be the length, $C D$ the breadth, of a required oval.

First, lay down the line $A B$, equal to the given length, and cross it in the middle with the perpendicular $C D$, equal to the given breadth. Secondly, take in half the line $A B$ with your compasses, viz. $A E$ or $B E$, set one foot in C , and make two marks upon the line $A B$, viz. f and g ; also, with the same extent, set one foot in D , and cross the former marks at f and g . Thirdly, at the points f and g , fix two pins; or, if it be a garden-plot, or the like, two strong sticks; then putting a line about them, make fast the ends at such an exact length, that stretching by the two pins, the bent of the line may exactly touch A or B , or C , or D , or h , as in this diagram it does at h ; so moving the line still round, it will describe an exact oval.

Menfuration of Superficies.

C H A P. IV.

Superficial figures, are all fuch as have only length and breadth, without any confiderable thicknefs, as fig. 11, in the following plate, called a parallelogram, or long fquare, which, to find the true content thereof, this is the rule:

Multiply the length by the breadth, and the product is the superficial content, either of a parallelogram, or a fquare figure of four equal fides, as fig. 11.

E X A M P L E.

Suppofe the length be

feet 5 6 inches
and breadth 2 4 inches

$$\begin{array}{r}
 \text{feet} \quad 5 \quad 6 \text{ inches} \\
 \text{and breadth} \quad \quad 2 \quad 4 \text{ inches} \\
 \hline
 \quad \quad \quad 1 \quad 10 \quad 0 \\
 \quad \quad \quad 11 \quad 0 \\
 \hline
 \text{content in feet} \quad 12 \quad 10 \quad 0
 \end{array}$$

To meafure a Triangle, as Fig. 6, 7, or 8.

Rule,

Multiply the longeft fide (which is ufually called the bafe) by half the perpendicular; let fall from the angle, oppofite to the bafe, and the product is the anfwer.

E X A M P L E.

Suppose the longest side, or base, be

| | f. | i. |
|------------------------|----|-----|
| | 10 | 6 |
| half the perpendicular | | 49 |
| | 7 | 106 |
| | 42 | 0 |
| content in feet | 49 | 106 |

Note, That in triangles, such as fig. 6 and 7, the perpendicular must be let fall from the angle at A and B, to the base.

To measure a Trapezium, as Fig. 13.

First, draw the diagonal, or base line, BC, which divides the trapezium into two triangles, viz. BAC and BDC; next, draw a diagonal line from A to D, crossing the base line BC, in the point F, which said line give you the two perpendiculars, viz. AF, the greater triangle, and FD, to the lesser triangle; then proceed to measure the two triangles, according to the former directions, and add the two products together, and that product is the content of the whole trapezium.

E X A M-

E X A M P L E.

In triangle B A C, the base is 16.6
and perpendicular, 10.10 (half}
of which, is) - - - - }

5.5

830
830

content 91.30

In the triangle, B D C, the }
base as before, is - - - - } 16.6
and the perpendicular, F D, is }
4, the half of which, is }

2

332
91.30

content
to which add the former - -

and the product is - - -

124.50

the content of the trapezium, as required.

Or by this method,

Add the two perpendiculars together, viz.
10.10 and 4, and their sum is, 14.10
which, multiplied by half the base 8.3

450
1200

and the product (as above) is

124.50

the content of the trapezium.

Note, These two methods being perform'd by
Decimals, shall give one example more, after
the manner of feet and inches.

G g 2

Thus,

Thus,

| | | |
|-------------------------------|-------|------|
| | f. | i. |
| the base is | 16 | 6 |
| half the perpendic. added, is | | 7 5 |
| | <hr/> | |
| | 6 | 10 6 |
| | 115 | 6 |
| | <hr/> | |
| the content in feet | 122 | 4 6 |
| | <hr/> | |

Note, If you esteem the decimal parts of a foot to be inches (as in the above example), the content is only 122 feet, 4 inches, and 6 parts.

To find the Area, or content of a Pentagon, Hexagon, Heptagon, Octagon,, &c. as fig. 32.

R U L E.

From the center K, draw the lines F and L, observing that KM is the perpendicular.— Measure the triangle KFL, as before is taught, and the product, multiplied by 5, is the content of the pentagon; and according to the number of the sides of any figure, as above, you may find the content thereof.

E X A M P L E.

| | | |
|---------------------------------|-------|------------------|
| The perpendicular, KM, is | 18 | the base, FL, 20 |
| The half base, FM, or ML, is | 10 | |
| | <hr/> | |
| The content of the triangle, is | 180 | which multiplied |
| By the number of sides | 5 | is |
| | <hr/> | |
| The content of the pentagon | 900 | as required; |
| | <hr/> | |

and by this method, all those figures express'd in the table foregoing, of whatsoever number of sides, may be measured.

The diameter of a circle being given to find the circumference thereof, arithmetically, as fig. 14.

Rule,

As 7 is to 22, so is the diameter to the circumference; thus, by the Rule of Three.

Suppose the diameter be 14, what is the circumference of that circle?

Thus,

$$\begin{array}{rcl}
 \text{As} & 7 : 22 :: 14 & \text{the diameter to} \\
 & \frac{14}{88} & \\
 & \frac{22}{28} & \\
 & 7)308(44 & \text{circumference required.} \\
 & \frac{28}{28} & \\
 & \frac{28}{..} & \\
 & \frac{..}{..} &
 \end{array}$$

Fig. 14.

The diameter (of a circle) and the circumference, being given to find the area, or superficial content.

Rule.

Multiply half the diameter by half the circumference, and the product thereof shews the content of any circle; or, multiply the whole circumference by the semi, (or half) diameter, and half that product is the content.

Having

Having only the diameter of a circle given to find the content, this is the Rule:

Say, as 7 is to 22, so is the square of the semi-diameter to the content of the circle.

The semi-diameter is half of 14
the diameter, viz. 7

7

Then say, as : 22 : : 49 the square to

49

198

88

7)1078(154 content required

7

37

35

28

28

Having the circumference given to find the content.

Rule,

As 88 (being 4 times 22) is to 7, so is the square of the circumference to the content.

The circumference is 44 as before
the square of which, 44

176

176

is 1936 sq. of circumf.

Then say, as 88 : 7 :: 1936 ditto

7

divisor 88) 13552) 154 content req.
88

475

440

352

352

...

—

The content of a circle being given to find the diameter.

Rule,

As 22 is to 28, so is the content to the square of the diameter; or thus, more exactly: as 355 is to 452, so is the content given, to the square of the diameter.

EXAM-

The content of a circle being given to find the circumference.

Rule,

As 7 is to 88, so is the content to the square of the circumference.

$$7 : 88 :: 154 \\ 88$$

$$\begin{array}{r} 1232 \text{ extracted, is} \\ 1232 \end{array}$$

$$\begin{array}{r} 7 \overline{)13552} (1936 (44 \text{ root} = \text{to circumf.} \\ \underline{7 \cdots 16} \\ 65 \quad 84 \overline{)336} \\ \underline{63} \quad \underline{336} \\ 25 \quad \cdots \\ \underline{21} \quad \smile \\ 42 \end{array}$$

The content of a circle being given to find the side of a square; the content of which square, shall be equal to the content of a circle.

Rule,

Extract the Square Root of the given content, and that root is the side of a square required.

The content as before, is 154

Extract $15400(12.4$ the root, or side of a square,

$$\begin{array}{r} \text{I} \\ 22 \overline{)54} \\ \underline{44} \\ 244 \overline{)1000} \\ \underline{976} \\ \cdot 24 \end{array} \quad \text{equal, as required}$$

The proof, thus,

| | |
|-----------------------------|--|
| Side of the square | 12.4 |
| | 124 |
| | <hr style="width: 100px; border: 0.5px solid black;"/> |
| | 496 |
| | 248 |
| | 124 |
| | <hr style="width: 100px; border: 0.5px solid black;"/> |
| to which, add the remainder | 15376 |
| | 24 |
| | <hr style="width: 100px; border: 0.5px solid black;"/> |

the content of the square 154.00
which is equal to the content of the circle, as required.

The diameter of a circle being given to find the side of a square; the area of which square, shall be equal to the area of the circle of the given diameter.

Rule,

As 113 is to 355, so is the square of the diameter to the content required,

EXAM-

EXAMPLE.

As 113 : 355 :: 7 the semi-diameter

49 49 square

3195
1420

113)17395(153 ¹⁰⁶ which, altho' not exactly 154
113 (the real content), this propor-
tion works nearest the truth of
any other.

609
565

445
339

106

The diameter of a circle being given, to find the side of a square, which may be inscribed within that circle.

Rule,

Square the diameter, and the root of half the the product is the side of the square required.

E X A M P L E.

The diameter is 14, which squared, is 196

$$\begin{array}{r}
 14 \\
 \hline
 56 \\
 14 \\
 \hline
 2)196)98 \text{ half the sq. of diam.} \\

 \hline
 188)1700 \\
 1504 \\
 \hline
 196
 \end{array}$$

To find the superficial content of an Oval,
as fig. 35.

Rule,

Multiply one diameter by the other, and extract the square root of that product, and that root shall be equal to the distance of a circle, whose superficial content shall be equal to the oval given; which may be found as before. See fig. 14.

transverse diameter 18
conjugate ditto 12

extract the square root of 216 ($14.6\frac{284}{286}$ diameter of the circle)

$$\begin{array}{r} 1 \\ \hline 24) 116 \\ 96 \\ \hline 286) 2000 \\ 1716 \\ \hline 284 \end{array}$$

To find the content.

As 7 : 22 :: 14 : 6 which is near enough,
22 without the fraction

$$\begin{array}{r} 292 \\ 292 \\ \hline 7) 321.2) 45.8 \text{ circumference} \\ 28 \\ \hline .41 \\ 35 \\ \hline .62 \\ 56 \\ \hline .0 \end{array}$$

| | |
|---------------------------------|--------|
| half the circumference, is | 22.9 |
| half the diameter, is | 7.3 |
| | <hr/> |
| | 687 |
| | 1603 |
| | <hr/> |
| the content | 167.17 |
| equal to the oval, as required. | |

Note, The above work is perform'd by the method of decimals; but if you esteem the diameter and circumference given in feet and inches, you must work by that method throughout; but this above (to those acquainted with it) is the most concise, and also correct; and saves abundance of trouble, in respect to that of squaring feet and inches.

Problem 13. Fig. 31.

Three points being given, how to make a circle, whose circumference shall pass through the three given points, provided the three points are not in a straight line.

Let ABC be the three points given; first, setting one foot of your compasses in A; open them to any convenient wideness, more than half the distance between A and B, and describe the arch towards B; with the same extent of the compasses, set one foot also in B, and describe the arch towards A, and draw a straight line through the intersection, as in the figure; the very same you must do between B and C, drawing a line also through the two intersections of the arches; then, at the very place where the two lines intersect each other, is the center of the circle required, which is at D; which setting one foot of the compasses thereon, extend the other to either of the points given, and describe the circle ABC.

Note, The center of a triangle is found the same way.

Problem 14. Fig. 31.

To find the diameter of a circle, by having one part of the diameter given; also, having the length of the chord crossing the diameter in the given part.

Rule,

Square the half of the chord-line, A B, and divide the product by the given part of the diameter, D C, the quotient being added to the said given part, is the length of the diameter required.

E X A M P L E.

Let A C B be a segment given, whose chord A B, is 36, and the versed sine C D, 6; half 36 is 18, which squar'd, makes 324; this divided by 6, the quotient is 54; to which add 6, the sum is 60, the diameter of the circle C E.

See the work.

$$\begin{array}{rcl}
 18 & \text{half the chord} & \\
 18 & & \\
 \hline
 144 & & \\
 18 & & \\
 \hline
 6 \overline{) 324} & \text{the square of AD} & \\
 \underline{54} & \text{the part wanting, DE} & \\
 6 & \text{the versed sine CD, added} & \\
 \hline
 60 & \text{the diameter, CE.} &
 \end{array}$$

Any

Any segment of a circle being given, whose chord-line doth not exceed the chord of the quadrant of the same circle, to find the content, without finding the diameter, and without describing any more of the circumference, which, in small segments, come very near the truth. Let the segment given, be fig. 37, whose chord-line is AB ; and the part of the diameter, cut off by the chord-line, DC , the content of this segment is required?

Rule,

Take the whole length of the chord AB , and 3-twelfths of the length of the line DC ; to which add, 7-twelfths of the same line; then multiply those two lengths, and the product gives you the content.

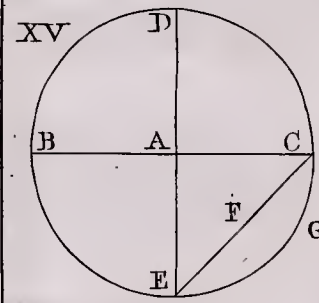

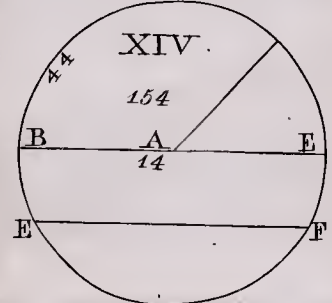

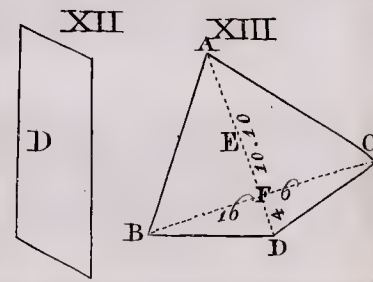

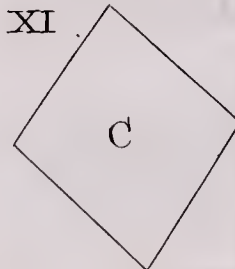

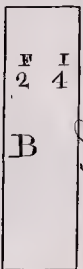

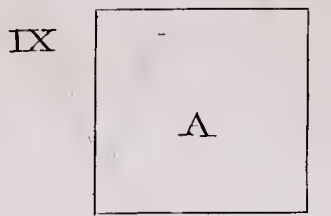

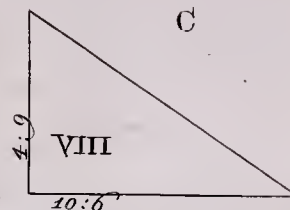

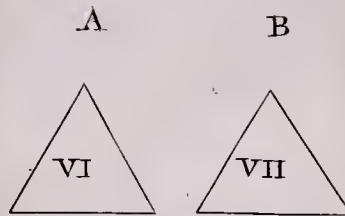

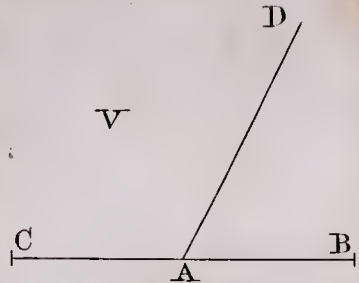

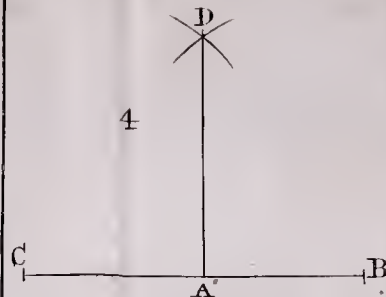

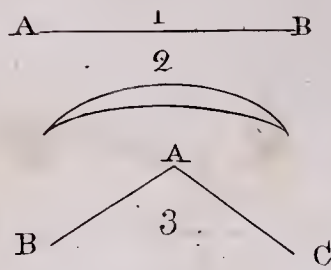

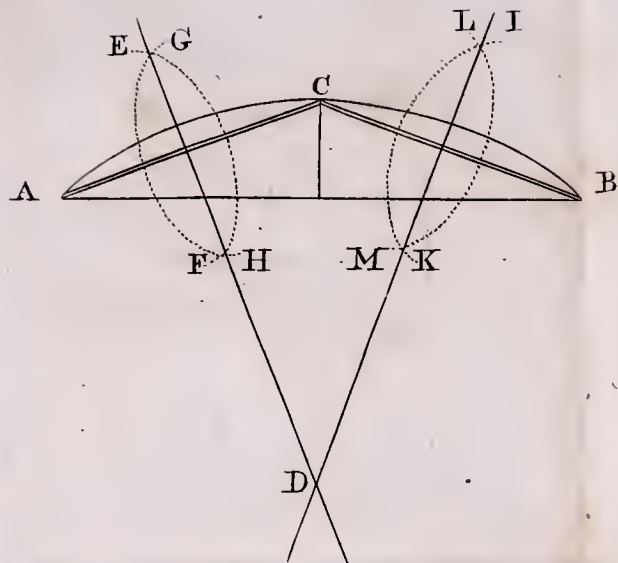

E X A M P L E.

| | |
|--|-------|
| The whole length of the chord, AB , is | 36 |
| and two thirds of the length, DC , is | 4 |
| to which add, 7-12ths of the same line | 3.5 |
| the product is | 7.5 |
| which, multiplied by the chord, AB , | 36 |
| | 450 |
| | 225 |
| | 270.0 |

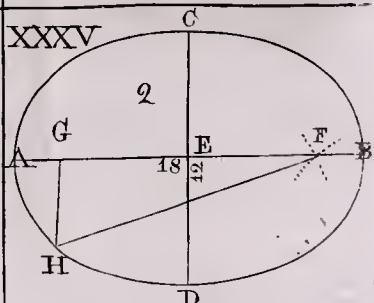

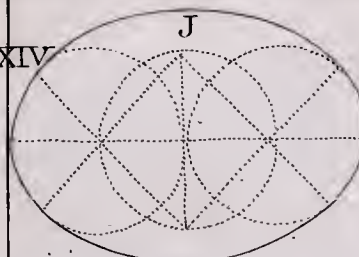

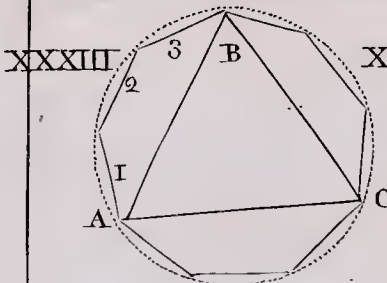

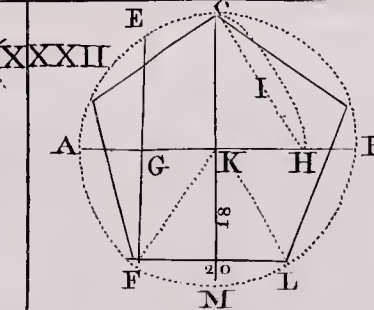

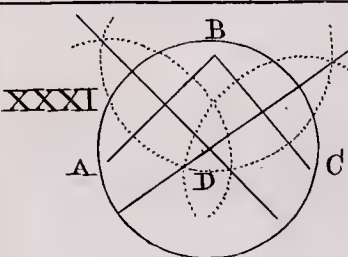

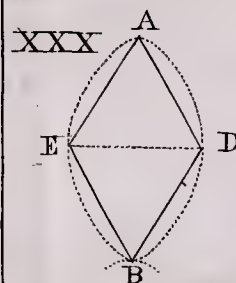

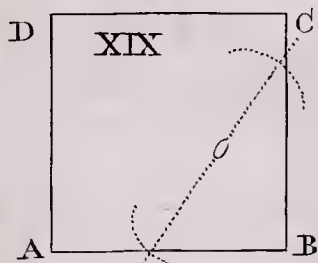

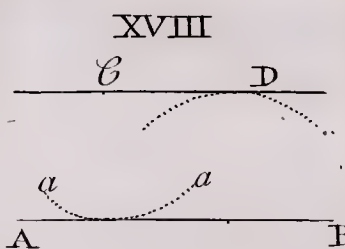

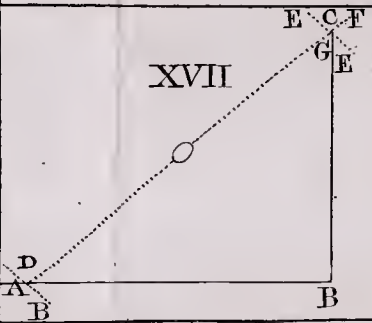

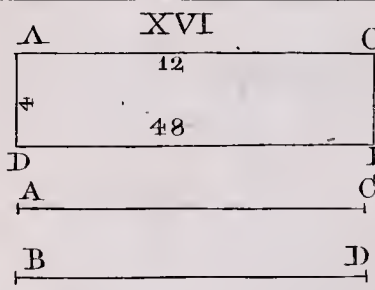

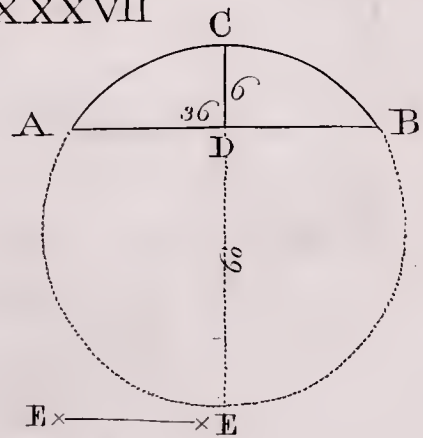

the content thereof, as required.
